

Real-Time Systems

Lecture 03: Duration Calculus I

2011-05-03

Dr. Bernd Westphal

Albert-Ludwigs-Universität Freiburg, Germany

– 03 – 2011-05-03 – main –

Contents & Goals

Last Lecture:

- Model of timed behaviour: state variables and their interpretation
- First order predicate-logic for requirements and system properties

This Lecture:

- **Educational Objectives:** Capabilities for following tasks/questions.
 - Read (and at best also write) Duration Calculus formulae.
- **Content:**
 - Classes of requirements (safety, liveness, etc.)
 - Duration Calculus:
Assertions, Terms, Formulae, Abbreviations, Examples

– 03 – 2011-05-03 – Prelim –

Recall: Correctness

Recall: Correctness

- Let 'Req' be a **requirement**,
- 'Des' be a **design**, and
- 'Impl' be an **implementation**.

Recall: each is a set of evolutions, i.e. a subset of $(\text{Time} \rightarrow \times_{i=1}^n \mathcal{D}(\text{obs}_i))$, described in any form.

We say

- 'Des' is a **correct design** (wrt. 'Req') if and only if

$$\text{Des} \subseteq \text{Req}.$$

- 'Impl' is a **correct implementation** (wrt. 'Des' (or 'Req')) if and only if

$$\text{Impl} \subseteq \text{Des} \quad (\text{or } \text{Impl} \subseteq \text{Req})$$

If 'Req' and 'Des' are described by formulae of first-order predicate logic, proving the design correct amounts to proving that $\text{Des} \implies \text{Req}$ is valid.

Recall: Kinds of Requirements and System Properties

Recall: Kinds of Requirements and System Properties

Assume observables

- $C : \{0, 1\}$, $C(t) = 1$ represents a **critical system state** at time t ;
- $G : \{0, 1\}$, $G(t) = 1$ represents a **good system state** at time t ;
- $R : \{0, 1\}$, $R(t) = 1$ represents a **request** at time t .
- Typical **safety** property:

$$\forall t \in \text{Time} \bullet \neg C(t)$$

- Typical **liveness** property:

$$\exists t \in \text{Time} \bullet G(t)$$

characterise interval,
e.g. $|b-e| \geq 60$

- Typical **bounded response** property:

$$\forall t_1 \in \text{Time} \bullet (R(t_1) \implies \exists t_2 \in [t_1 + 10, t_1 + 15] \bullet G(t_2))$$

expression over b, e ,
e.g. $0,05 \cdot |b-e|$

- Typical **duration** property:

$$\forall b, e \in \text{Time} \bullet \left(A(b, e) \implies \int_b^e O(t) dt \leq \theta(b, e) \right)$$

Duration Calculus

Duration Calculus: Preview

- Duration Calculus is an **interval logic**.
- Formulae are evaluated in an (**implicitly given**) interval.

Back to our gas burner:

- $G, F, I, H : \text{Time} \rightarrow \{0, 1\}$
- Define $L : \text{Time} \rightarrow \{0, 1\}$ as $G \wedge \neg F$.

Strangest operators:

- **everywhere** ^{almost} — Example: $\lceil G \rceil$
(Holds in a given interval $[b, e]$ iff the gas valve is open almost everywhere.)
- **chop** — Example: $(\lceil \neg I \rceil ; \lceil I \rceil ; \lceil \neg I \rceil) \implies \ell \geq 1$
(Ignition phases last at least one time unit.)
- **integral** — Example: $(\ell \geq 60 \implies \int L \leq \frac{\ell}{20})$
(At most 5% leakage time within intervals of at least 60 time units.)

Duration Calculus: Overview

We will introduce three (or five) syntactical “levels”:

- (i) **Symbols:** $p_i, f, g, true, false, =, <, >, \leq, \geq, x, y, z, X, Y, Z, d$
- (ii) **State Assertions:** $P ::= 0 \mid 1 \mid X = d \mid \neg P_1 \mid P_1 \wedge P_2$ *yield 0,1*
- (iii) **Terms:** $\theta ::= x \mid \ell \mid \int \underline{P} \mid f(\theta_1, \dots, \theta_n)$ *yield \mathbb{R}*
- (iv) **Formulae:** $F ::= p(\theta_1, \dots, \theta_n) \mid \neg F_1 \mid F_1 \wedge F_2 \mid \forall x. F_1 \mid F_1 ; F_2$ *yield \mathbb{H}, ff*
- (v) **Abbreviations:** $[], [P], [P]^t, [P]^{\leq t}, \diamond F, \square F$

- 03 - 2011-05-03 - 5dresymb -

9/39

Symbols: Syntax

- f, g : **function symbols**, each with arity $n \in \mathbb{N}_0$.
Called **constant** if $n = 0$.
Assume: constants $0, 1, \dots \in \mathbb{N}_0$; binary '+' and '.'; ternary \rightarrow
n=2 *n=3*
- p, q : **predicate symbols**, also with arity.
Assume: constants *true, false*; binary $=, <, >, \leq, \geq$.
- $x, y, z \in \text{GVar}$: **global variables**.
- $X, Y, Z \in \text{Obs}$: **state variables** or **observables**, each of a data type \mathcal{D}
(or $\mathcal{D}(X), \mathcal{D}(Y), \mathcal{D}(Z)$ to be precise). *T: {red, green, yellow}*
Called **boolean observable** if data type is $\{0, 1\}$.
- d : **elements** taken from data types \mathcal{D} of observables.
e.g. red, green, yellow

- 03 - 2011-05-03 - 5dresymb -

10/39

Symbols: Semantics

- **Semantical domains** are
 - the **truth values** $\mathbb{B} = \{\text{tt}, \text{ff}\}$,
 - the **real numbers** \mathbb{R} ,
 - **time** Time,
(mostly $\text{Time} = \mathbb{R}_0^+$ (continuous), exception $\text{Time} = \mathbb{N}_0$ (discrete time))
 - and **data types** \mathcal{D} .
- The semantics of an n -ary **function symbol** f is a (mathematical) function from \mathbb{R}^n to \mathbb{R} , denoted \hat{f} , i.e.

$$\hat{f} : \mathbb{R}^n \rightarrow \mathbb{R}.$$

- The semantics of an n -ary **predicate symbol** p is a function from \mathbb{R}^n to \mathbb{B} , denoted \hat{p} , i.e.

$$\hat{p} : \mathbb{R}^n \rightarrow \mathbb{B}.$$

- For constants (arity $n = 0$) we have $\hat{f} \in \mathbb{R}$ and $\hat{p} \in \mathbb{B}$.

- 03 - 2011-05-03 - 54resymb -

11/39

Symbols: Examples

- The **semantics** of the function and predicate symbols **assumed above** is fixed throughout the lecture:

- $\hat{true} = \text{tt}$, $\hat{false} = \text{ff}$ • $\hat{\cdot} : \mathbb{R}^2 \rightarrow \mathbb{R}$ is multiplication

- $\hat{0} \in \mathbb{R}$ is the (real) number **zero**, etc.

- $\hat{+} : \mathbb{R}^2 \rightarrow \mathbb{R}$ is the **addition** of real numbers, etc.

- $\hat{=}$: $\mathbb{R}^2 \rightarrow \mathbb{B}$ is the **equality** relation on real numbers,

- $\hat{<}$: $\mathbb{R}^2 \rightarrow \mathbb{B}$ is the **less-than** relation on real numbers, etc.

- $\hat{\max} : \mathbb{R}^3 \rightarrow \mathbb{R}$: we choose the maximum, so

$$\hat{\max}(a, b, c) = \begin{cases} c & \text{if } c > b \\ & \text{if } c > a \\ b & \text{if } b > a \\ & \text{if } b > c \\ a & \text{if } a > b \\ & \text{if } a > c \end{cases}$$

- "Since the semantics is the expected one, we shall often simply use the symbols $0, 1, +, \cdot, =, <$ when we mean their semantics $\hat{0}, \hat{1}, \hat{+}, \hat{\cdot}, \hat{=}, \hat{<}$."

- 03 - 2011-05-03 - 54resymb -

12/39

Symbols: Semantics

- The semantics of a **global variable** is not fixed (throughout the lecture) but given by a **valuation**, i.e. a mapping

$$\mathcal{V} : \text{GVar} \rightarrow \mathbb{R}$$

assigning each global variable $x \in \text{GVar}$ a real number $\mathcal{V}(x) \in \mathbb{R}$.

We use Val to denote the set of all valuations, i.e. $\text{Val} = (\text{GVar} \rightarrow \mathbb{R})$.

Global variables are though **fixed over time** in system evolutions.

- The semantics of a **state variable** is **time-dependent**. It is given by an interpretation \mathcal{I} , i.e. a mapping

$$\mathcal{I} : \text{Obs} \rightarrow (\text{Time} \rightarrow \mathcal{D})$$

assigning each state variable $X \in \text{Obs}$ a function

$$\mathcal{I}(X) : \text{Time} \rightarrow \mathcal{D}(X)$$

such that $(\mathcal{I}(X))(t) \in \mathcal{D}(X)$ denotes the value that X has at time $t \in \text{Time}$.

as before:

$$\begin{aligned} \pi : \text{Time} &\rightarrow \mathcal{D}(\text{Obs}_1) \times \dots \times \mathcal{D}(\text{Obs}_n) \\ \pi_{\text{Obs}} : \text{Time} &\rightarrow \mathcal{D}(\text{Obs}) \end{aligned}$$

Symbols: Representing State Variables

- For convenience, we shall abbreviate $\mathcal{I}(X)$ to $X_{\mathcal{I}}$.
- An **interpretation** (of a state variable) can be displayed in form of a **timing diagram**.

with $\mathcal{D}(X) = \{d_1, d_2\} \cup \{d_3\}$

$$\mathcal{D}(Y) = \{0, 1\}$$

Duration Calculus: Overview

We will introduce three (or five) syntactical “levels”:

(i) **Symbols:**

$0, 1, 3, 4, f, g, \text{ true, false, =, <, >, \leq, \geq, } x, y, z, X, Y, Z, d$

(ii) **State Assertions:**

$P ::= 0 \mid 1 \mid X = d \mid \neg P_1 \mid P_1 \wedge P_2$

(iii) **Terms:**

$\theta ::= x \mid \ell \mid \int P \mid f(\theta_1, \dots, \theta_n)$

(iv) **Formulae:**

$F ::= p(\theta_1, \dots, \theta_n) \mid \neg F_1 \mid F_1 \wedge F_2 \mid \forall x \bullet F_1 \mid F_1 ; F_2$

(v) **Abbreviations:**

$[], [P], [P]^t, [P]^{\leq t}, \diamond F, \square F$

could be
 $X \oplus d$
 $\neg X \wedge d$
 $\neg X \wedge d$

State Assertions: Syntax

- The set of **state assertions** is defined by the following grammar:

$$P ::= 0 \mid 1 \mid X = d \mid \neg P_1 \mid P_1 \wedge P_2$$

with $d \in \mathcal{D}(X)$, X observable,

We shall use P, Q, R to denote state assertions.

- Abbreviations:**

- We shall write X instead of $X = 1$ if $\mathcal{D}(X) = \{0, 1\}$
- Define \vee, \implies, \iff as usual.

State Assertions: Semantics

$$\mathcal{I}: \text{Obs} \rightarrow (\text{Time} \rightarrow \mathcal{D})$$

- The **semantics** of **state assertion** P is a function

$$\mathcal{I}[[P]] : \text{Time} \rightarrow \{0, 1\} \quad \text{or} \quad \bullet \llbracket \cdot \rrbracket (\cdot) : (\text{Obs} \rightarrow (\text{Time} \rightarrow \mathcal{D}))$$

i.e. $\mathcal{I}[[P]](t)$ denotes the truth value of P at time $t \in \text{Time}$.
under interpretation \mathcal{I} .

\times State Ass
 \times Time
 $\rightarrow \{0, 1\}$

- The value is defined **inductively** on the structure of P :

$$\mathcal{I}[[0]](t) = 0 \in \mathbb{R} \quad (\text{semantical domain})$$

$$\mathcal{I}[[1]](t) = 1$$

$$\mathcal{I}[[X = d]](t) = \begin{cases} 1, & \text{if } \mathcal{I}(X)(t) = \hat{d} \quad (\text{or } X_{\mathcal{I}}(t) = d) \\ 0, & \text{otherwise} \end{cases}$$

$$\mathcal{I}[[\neg P_1]](t) = 1 - \mathcal{I}[[P_1]](t)$$

$$\mathcal{I}[[P_1 \wedge P_2]](t) = \begin{cases} 1, & \text{if } \mathcal{I}[[P_1]](t) = \mathcal{I}[[P_2]](t) = 1 \\ 0, & \text{otherwise} \end{cases}$$

State Assertions: Notes

by def. on prev. slide

- $\mathcal{I}[[X]](t) = \mathcal{I}[[X = 1]](t) = \mathcal{I}(X)(t) = X_{\mathcal{I}}(t)$, if X boolean, i.e. $\mathcal{D}(X) = \{0, 1\}$
abbrev.
- $\mathcal{I}[[P]]$ is also called **interpretation** of P .
abbrev.

We shall write $P_{\mathcal{I}}$ for it.
 $\text{Time} \rightarrow \{0, 1\}$

- Here we prefer 0 and 1 as boolean values (instead of tt and ff) — for reasons that will become clear immediately.

State Assertions: Example

- Boolean observables G and F .
- State assertion $L := G \wedge \neg F$. (unabbrev.: $(G=1) \wedge \neg(F=1)$)

- $L_I(1.2) = 1$, because
 - $I[G \wedge \neg F](1.2) = 1$
 - because $I[G](1.2) = I[G](1.2) = 1$
 - $I[\neg F](1.2) = \neg I[F](1.2) = 1$
- $L_I(2) = 0$, because
 - $I[G](2) = 0$
