

Real-Time Systems

Lecture 11: Networks of Timed Automata

2012-06-26

Dr. Bernd Westphal

Albert-Ludwigs-Universität Freiburg, Germany

– 11 – 2012-06-26 – main –

Contents & Goals

Last Lecture:

- Timed automata syntax
- TA operational semantics

This Lecture:

- **Educational Objectives:** Capabilities for following tasks/questions.
 - what's a transition sequence, computation path, run?
 - what is Zeno behaviour?
 - what's the (syntactical) parallel composition of TA?
- **Content:**
 - transition sequence, computation path, run
 - parallel composition of TA
 - Uppaal demo

– 11 – 2012-06-26 – Prelim –

Recall: Plan

- **Pure TA** syntax
 - channels, actions
 - (simple) clock constraints
 - Def. TA
- **Pure TA** operational semantics
 - clock valuation, time shift, modification
 - operational semantics
 - discussion
- Transition sequence, computation path, run
- **Network of TA**
 - parallel composition (syntactical)
 - restriction
 - network of TA semantics
- **Uppaal Demo**
- Region abstraction; zones
- **Extended TA**; Logic of Uppaal

3/26

Computation Path, Run

Computation Paths

- $\langle \ell, \nu \rangle, t$ is called **time-stamped configuration**
- **time-stamped delay transition:** $\langle \ell, \nu \rangle, t \xrightarrow{t'} \langle \ell, \nu + t' \rangle, t + t'$
iff $t' \in \text{Time}$ and $\langle \ell, \nu \rangle \xrightarrow{t'} \langle \ell, \nu + t' \rangle$.
- **time-stamped action transition:** $\langle \ell, \nu \rangle, t \xrightarrow{\alpha} \langle \ell', \nu' \rangle, t$
iff $\alpha \in B_{?!}$ and $\langle \ell, \nu \rangle \xrightarrow{\alpha} \langle \ell', \nu' \rangle$.
- A sequence of time-stamped configurations

$$\xi = \langle \ell_0, \nu_0 \rangle, t_0 \xrightarrow{\lambda_1} \langle \ell_1, \nu_1 \rangle, t_1 \xrightarrow{\lambda_2} \langle \ell_2, \nu_2 \rangle, t_2 \xrightarrow{\lambda_3} \dots$$

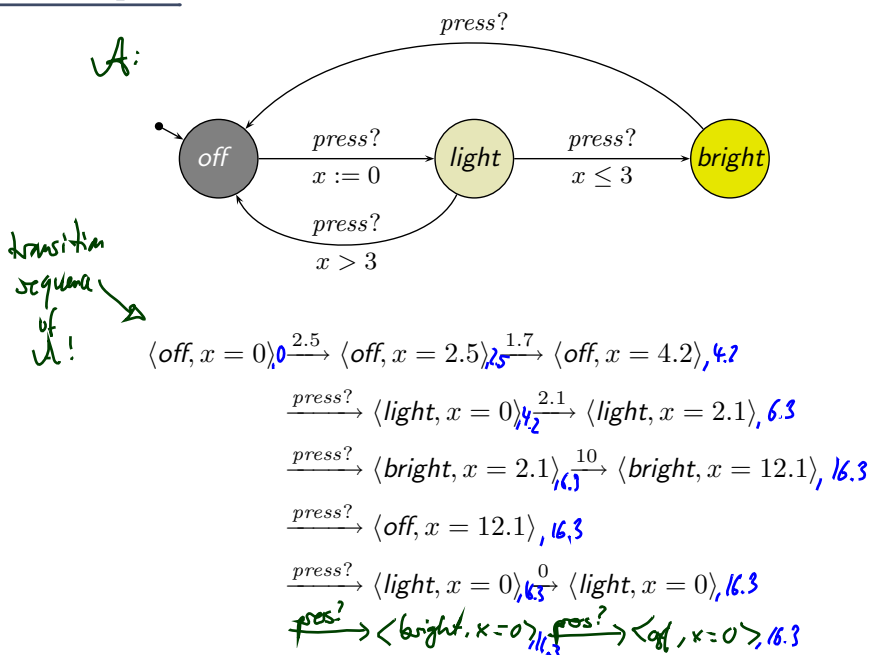

is called **computation path** (or path) of \mathcal{A} **starting in** $\langle \ell_0, \nu_0 \rangle, t_0$ if and only if it is either infinite or maximally finite.

- A **computation path** (or path) is a computation path starting at $\langle \ell_0, \nu_0 \rangle, 0$ where $\langle \ell_0, \nu_0 \rangle \in C_{ini}$.

21/31

Timelocks and Zeno Behaviour

- 11 - 2012-06-26 - Starin -

6/26

Timelocks and Zeno Behaviour

- **Timelock:**

$$\langle l, x = 0 \rangle, 0 \xrightarrow{2} \langle l, x = 2 \rangle, 2$$

$$\langle l', x = 0 \rangle, 0 \xrightarrow{3} \langle l', x = 3 \rangle, 3 \xrightarrow{a?} \langle l', x = 3 \rangle, 3 \xrightarrow{a?} \dots$$

- **Zeno behaviour:**

$$\langle l, x = 0 \rangle, 0 \xrightarrow{1/2} \langle l, x = 1/2 \rangle, \frac{1}{2} \xrightarrow{1/4} \langle l, x = 3/4 \rangle, \frac{3}{4} \dots$$

$$\xrightarrow{1/2^n} \langle l, x = (2^n - 1)/2^n \rangle, \frac{2^n - 1}{2^n} \dots$$

- 11 - 2012-06-26 - Starin -

6/26

Real-Time Sequence

Definition 4.9. An infinite sequence

$$t_0, t_1, t_2, \dots$$

of values $t_i \in \text{Time}$ for $i \in \mathbb{N}_0$ is called **real-time sequence** if and only if it has the following properties:

- **Monotonicity:**

$$\forall i \in \mathbb{N}_0 : t_i \leq t_{i+1}$$

- **Non-Zeno behaviour (or unboundedness or progress):**

$$\forall t \in \text{Time} \exists i \in \mathbb{N}_0 : t < t_i$$

Run

Definition 4.10. A **run** of \mathcal{A} **starting** in the time-stamped configuration $\langle \ell_0, \nu_0 \rangle, t_0$ is an infinite computation path of \mathcal{A}

$$\xi = \langle \ell_0, \nu_0 \rangle, t_0 \xrightarrow{\lambda_1} \langle \ell_1, \nu_1 \rangle, t_1 \xrightarrow{\lambda_2} \langle \ell_2, \nu_2 \rangle, t_2 \xrightarrow{\lambda_3} \dots$$

where $(t_i)_{i \in \mathbb{N}_0}$ is a real-time sequence.

If $\langle \ell_0, \nu_0 \rangle \in C_{ini}$ and $t_0 = 0$, then we call ξ a **run** of \mathcal{A} .

Example:

"does not have a run,
(Time stamps cannot grow
past 2.0.)"

Example

Network of TA

Recall: Light Controller and User

Parallel Composition

Definition 4.12.

The **parallel composition** $\mathcal{A}_1 \parallel \mathcal{A}_2$ of two timed automata

$$\mathcal{A}_i = (L_i, B_i, X_i, I_i, E_i, \ell_{ini,i}), \quad i = 1, 2,$$

with **disjoint** sets of clocks X_1 and X_2 yields the timed automaton

$$\mathcal{A} = (L_1 \times L_2, B_1 \cup B_2, X_1 \cup X_2, I, E, (\ell_{ini,1}, \ell_{ini,2}))$$

where

- $I(\ell_1, \ell_2) := I(\ell_1) \wedge I(\ell_2)$, and
- E consists of **handshake** and **asynchronous communication**.
(\rightarrow **next slide**)

Helper: Action Complementation

- The **complementation function**

$$\bar{\cdot} : Act \rightarrow Act$$

is defined pointwise as

- $\overline{a!} = a?$
- $\overline{a?} = a!$
- $\overline{\tau} = \tau$
- Note:** $\overline{\overline{\alpha}} = \alpha$ for all $\alpha \in Act$.

Parallel Composition: Handshake and Asynchrony

$\mathcal{A}_1 \parallel \mathcal{A}_2 = (L_1 \times L_2, B_1 \cup B_2, X_1 \cup X_2, I, E, (\ell_{ini,1}, \ell_{ini,2}))$ with

- Handshake:**

If there is $a \in B_1 \cup B_2$ such that

$(\ell_1, \alpha, \varphi_1, Y_1, \ell'_1) \in E_1$, and $(\ell_2, \bar{\alpha}, \varphi_2, Y_2, \ell'_2) \in E_2$,
and $\{a!, a?\} = \{\alpha, \bar{\alpha}\}$, then

$$((\ell_1, \ell_2), \tau, \varphi_1 \wedge \varphi_2, Y_1 \cup Y_2, (\ell'_1, \ell'_2)) \in E.$$

- Asynchrony:**

If $(\ell_1, \alpha, \varphi_1, Y_1, \ell'_1) \in E_1$ then for all $\ell_2 \in L_2$,

$$((\ell_1, \ell_2), \alpha, \varphi_1, Y_1, (\ell'_1, \ell_2)) \in E.$$

If $(\ell_2, \alpha, \varphi_2, Y_2, \ell'_2) \in E_2$ then for all $\ell_1 \in L_1$,

$$((\ell_1, \ell_2), \alpha, \varphi_2, Y_2, (\ell_1, \ell'_2)) \in E.$$

Example

$$L_1 \times L_2 = \{ (off, l_0), \dots, (off, l_4), (light, l_0), \dots, (light, l_4), (bright, l_0), \dots, (bright, l_4) \}$$

$$B_1 \cup B_2 = \{ press \} \quad X_1 \cup X_2 = \{ x, y \} \quad (\ell_{ini,1}, \ell_{ini,2}) = (off, l_0)$$

$$I(off, l_0) = true \wedge true$$

$$I(light, l_0) = true \wedge y < 2$$

$$\vdots$$

Examples for handshake:

- $(off, l_0), \tau, true \wedge true, \{x, y\}, (light, l_1)$
- $(light, l_0), \tau, x \leq 3 \wedge true, \{y\}, (bright, l_1)$
- $(light, l_0), \tau, x > 3 \wedge true, \{y\}, (off, l_0)$

$$\mathcal{L} \parallel \mathcal{U} = (L_1 \times L_2, B_1 \cup B_2, X_1 \cup X_2, I, E, (\ell_{ini,1}, \ell_{ini,2}))$$

- If $a \in B_1 \cup B_2$ s.t. $(\ell_1, \alpha, \varphi_1, Y_1, \ell'_1) \in E_1$ and $(\ell_2, \bar{\alpha}, \varphi_2, Y_2, \ell'_2) \in E_2$ and $\{a!, a?\} = \{\alpha, \bar{\alpha}\}$ then $((\ell_1, \ell_2), \tau, \varphi_1 \wedge \varphi_2, Y_1 \cup Y_2, (\ell'_1, \ell'_2)) \in E$
- If $(\ell_1, \alpha, \varphi_1, Y_1, \ell'_1) \in E_1$ then for all $\ell_2 \in L_2$, $((\ell_1, \ell_2), \alpha, \varphi_1, Y_1, (\ell'_1, \ell_2)) \in E$, and conversely

Examples for asynchrony:

- $(light, l_3), press!, y > 3, \emptyset, (light, l_4)$
- $(light, l_3), press?, x \leq 3, \emptyset, (bright, l_3)$
- $(light, l_3), press?, x > 3, \emptyset, (off, l_3)$

Restriction

Definition 4.13.

A **local channel** b is introduced by the **restriction operator** which, for a timed automaton $\mathcal{A} = (L, B, X, I, E, \ell_{ini})$ yields

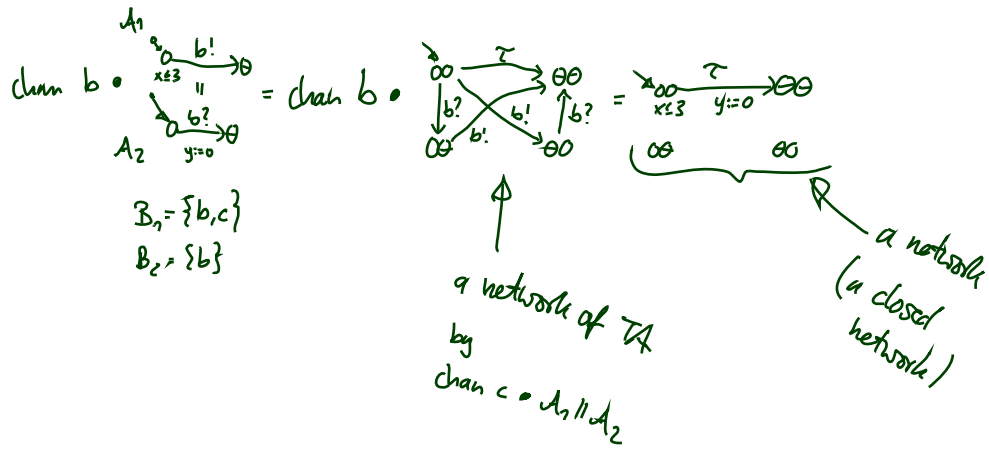

$$\underline{\text{chan } b} \bullet \mathcal{A} := (L, B \setminus \{b\}, X, I, E', \ell_{ini})$$

where

- $(\ell, \alpha, \varphi, Y, \ell') \in E'$
if and only if $(\ell, \alpha, \varphi, Y, \ell') \in E$ and $\alpha \notin \{b!, b?\}$.

• Abbreviation:

$$\text{chan } b_1 \dots b_m \bullet \mathcal{A} := \text{chan } b_1 \bullet \dots \text{chan } b_m \bullet \mathcal{A}$$

Networks of Timed Automata

- A timed automaton \mathcal{N} is called **network of timed automata** if and only if it is obtained as

$$\text{chan } b_1 \dots b_m \bullet (A_1 || \dots || A_n)$$

Closed Networks

- A network

$$\mathcal{N} = \text{chan } b_1 \dots b_m \bullet (\mathcal{A}_1 \parallel \dots \parallel \mathcal{A}_n)$$

is called **closed** if and only if

$$\{b_1, \dots, b_m\} = \bigcup_{i=1}^n B_i.$$

- Then, by Lemma 4.16 (later), **local transitions** don't occur (since $B = \emptyset$). Transitions are thus either internal actions τ or delay transitions.

Example:

18/26

Operational Semantics of Networks

Lemma 4.16. Let $\mathcal{A}_i = (L_i, B_i, X_i, I_i, E_i, \ell_{ini,i})$ with $i = 1, \dots, n$ be a set of timed automata with disjoint clocks. Then the operational semantics of the network

$$\text{chan } b_1 \dots b_m \bullet (\mathcal{A}_1 \parallel \dots \parallel \mathcal{A}_n)$$

yields the labelled transition system

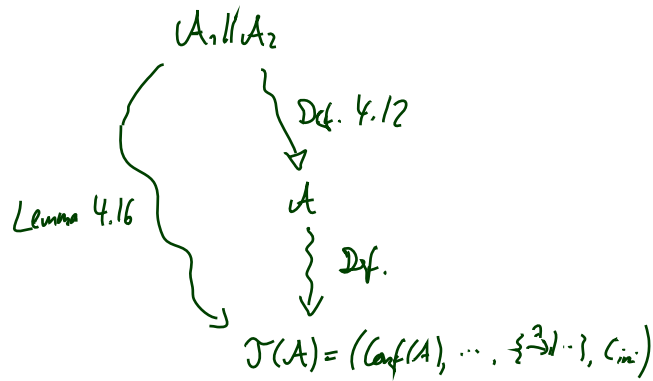

$$(\text{Conf}(\mathcal{N}), \text{Time} \cup B_{?1}, \{\xrightarrow{\lambda} \mid \lambda \in \text{Time} \cup B_{?1}\}, C_{ini})$$

with

- $X = \bigcup_{i=1}^n X_i$,
- $B = \bigcup_{i=1}^n B_i \setminus \{b_1, \dots, b_m\}$,
- $\text{Conf}(\mathcal{N}) = \{(\vec{\ell}, \nu) \mid \vec{\ell} \in L_1 \times \dots \times L_n \wedge \nu : X \rightarrow \text{Time} \wedge \nu \models \bigwedge_{k=1}^n I_k(\ell_k)\}$,
- $C_{ini} = \{(\ell_{ini,1}, \dots, \ell_{ini,n}, \nu_{ini})\} \cap \text{Conf}(\mathcal{N})$ where $\nu_{ini}(x) = 0$ for all $x \in X$,
- and three types of transition relations (\rightarrow **next slides**).

– 11 – 2012-06-26 – Stannet –

19/26

Operational Semantics of Networks: Local Transitions

For each $\lambda \in \text{Time} \cup B_{!?}$ the transition relation $\xrightarrow{\lambda} \subseteq \text{Conf}(\mathcal{N}) \times \text{Conf}(\mathcal{N})$ has one of the following three types:

(i) **Local transition:**

$$\langle \vec{\ell}, \nu \rangle \xrightarrow{\alpha} \langle \vec{\ell}', \nu' \rangle$$

if there is $i \in \{1, \dots, n\}$ such that

- $(\ell_i, \alpha, \varphi, Y, \ell'_i) \in E_i, \alpha \in B_{!?},$ (i -th automaton has corresp. edge)
- $\nu \models \varphi,$ (guard is satisfied)
- $\vec{\ell}' = \vec{\ell}[\ell_i := \ell'_i],$ (only i -th location changes)
- $\nu' = \nu[Y := 0],$ and (\mathcal{A}_i 's clocks are reset)
- $\nu' \models I_i(\ell'_i).$ (destination invariant holds)

(ii) **Synchronisation transition:**

$$\langle \vec{\ell}, \nu \rangle \xrightarrow{\tau} \langle \vec{\ell}', \nu' \rangle$$

if there are $i, j \in \{1, \dots, n\}$, $i \neq j$, and $b \in B_i \cap B_j$, such that

- $(\ell_i, b!, \varphi_i, Y_i, \ell'_i) \in E_i$ and $(\ell_j, b?, \varphi_j, Y_j, \ell'_j) \in E_j$,
- $\nu \models \varphi_i \wedge \varphi_j$,
- $\vec{\ell}' = \vec{\ell}[\ell_i := \ell'_i][\ell_j := \ell'_j]$,
- $\nu' = \nu[Y_i \cup Y_j := 0]$, and
- $\nu' \models I_i(\ell'_i) \wedge I_j(\ell'_j)$.

(iii) **Delay transition:**

$$\langle \vec{\ell}, \nu \rangle \xrightarrow{t} \langle \vec{\ell}, \nu + t \rangle$$

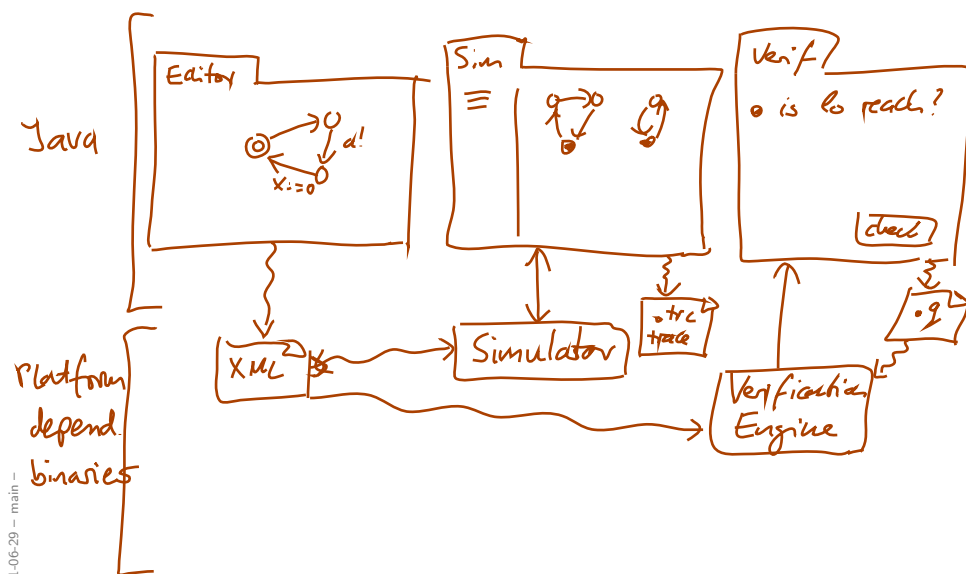

if for all $t' \in [0, t]$,

- $\nu + t' \models \bigwedge_{k=1}^n I_k(\ell_k)$.
