

Real-Time Systems

Lecture 11: Networks of Timed Automata

2012-06-26

Dr. Bernd Westphal

Albert-Ludwigs-Universität Freiburg, Germany

Contents & Goals

Last Lecture:

- Timed automata syntax
- TA operational semantics

This Lecture:

- Educational Objectives:** Capabilities for following tasks/questions:
 - what's a transition sequence, computation path, run?
 - what is Zeno behaviour?
 - what's the (syntactical) parallel composition of TAs?

Content:

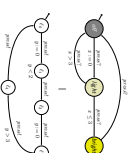

- transition sequence, computation path, run
- parallel composition of TA
- Uppaal demo

Recall: Plan

- Pure TA syntax
 - channels, actions
 - (simple) clock constraints
- Def. TA
- Pure TA operational semantics
 - clock valuation, time shift, modification
 - operational semantics
- discussion

- Transition sequence, computation path, run

- Network of TA
 - parallel composition (syntactical)
 - restriction
 - network of TA semantics
- Uppaal Demo
- Region abstraction: zones
- Extended TA: Logic of Uppaal

Computation Path, Run

- $(\ell, \nu), t$ is called **time-stamped configuration**
- time-stamped delay transition:** $(\ell, \nu), t \xrightarrow{\Delta} (\ell, \nu + \ell), t + \ell$
iff $t \in \text{Time}$ and $(\ell, \nu) \xrightarrow{\Delta} (\ell, \nu + \ell)$
- time-stamped action transition:** $(\ell, \nu), t \xrightarrow{a} (\ell', \nu'), t$
iff $\alpha \in B_{TA}$ and $(\ell, \nu) \xrightarrow{a} (\ell', \nu')$

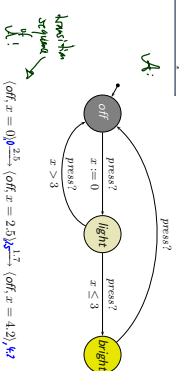

- A sequence of time-stamped configurations

$$\xi = (\ell_0, \nu_0), t_0 \xrightarrow{\Delta_0} (\ell_1, \nu_1), t_1 \xrightarrow{\Delta_1} (\ell_2, \nu_2), t_2 \xrightarrow{\Delta_2} \dots$$

- is called **computation path** (or path) of \mathcal{A} **starting in** $(\ell_0, \nu_0), t_0$ if and only if it is **either infinite or maximally finite**.

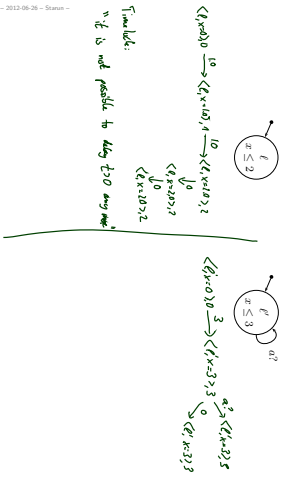

- A **computation path** (or path) is a computation path starting at $(\ell_0, \nu_0), 0$ where $(\ell_0, \nu_0) \in \mathcal{C}_{TA}$.

Example

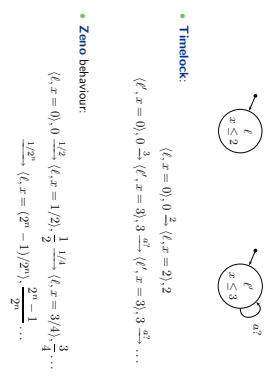

$$\begin{aligned} \text{press?}^0 & (\text{off}, x=0) \xrightarrow{2.5} (\text{off}, x=2.5) \xrightarrow{1.7} (\text{off}, x=4.2) \xrightarrow{1.3} \dots \\ \text{press?}^1 & (\text{light}, x=0) \xrightarrow{2.1} (\text{light}, x=2.1) \xrightarrow{1.0} \dots \\ \text{press?}^2 & (\text{bright}, x=2.1) \xrightarrow{1.0} (\text{bright}, x=3.1) \xrightarrow{1.3} \dots \\ \text{press?}^3 & (\text{off}, x=12.1) \xrightarrow{0.3} \dots \\ \text{press?}^4 & (\text{light}, x=0) \xrightarrow{0.6} (\text{light}, x=0.6) \xrightarrow{0.3} \dots \\ \text{press?}^5 & (\text{bright}, x=0.6) \xrightarrow{0.3} (\text{bright}, x=0.9) \xrightarrow{0.3} \dots \end{aligned}$$

Timelocks and Zero Behaviour

11 - 2012-06-26 - Stefan - 6/5a

Timelocks and Zero Behaviour

11 - 2012-06-26 - Stefan - 6/5a

Real-Time Sequence

Definition 4.9. An infinite sequence t_0, t_1, t_2, \dots of values $t_i \in \text{Time}$ for $i \in \mathbb{N}_0$ is called **real-time sequence** if and only if it has the following properties:

- **Monotonicity:** $\forall i \in \mathbb{N}_0 : t_i \leq t_{i+1}$
- **Non-Zero behaviour (or unboundness or progress):** $\forall t \in \text{Time} \exists i \in \mathbb{N}_0 : t < t_i$

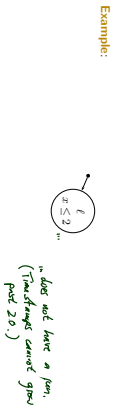

11 - 2012-06-26 - Stefan - 7/a

Run

Definition 4.10. A run of \mathcal{A} starting in the time-stamped configuration $\langle t_0, t_0 \rangle$, t_0 is an infinite computation path of \mathcal{A}

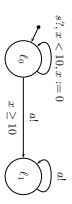

$$\xi = \langle t_0, t_0 \rangle, t_0 \xrightarrow{a_1} \langle t_1, t_1 \rangle, t_1 \xrightarrow{a_2} \langle t_2, t_2 \rangle, t_2 \xrightarrow{a_3} \dots$$

where $(t_i)_{i \in \mathbb{N}_0}$ is a real-time sequence.
If $\langle t_0, t_0 \rangle \in C_{\text{init}}$ and $t_0 = 0$, then we call ξ a run of \mathcal{A} .

11 - 2012-06-26 - Stefan - 8/5a

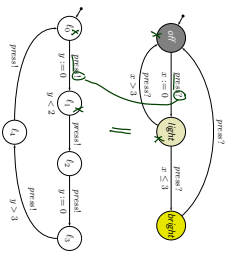

Example

11 - 2012-06-26 - Stefan - 9/5a

Network of TA

11 - 2012-06-26 - Stefan - 10/a

Definition 4.12.
 The parallel composition $\mathcal{A} \parallel \mathcal{A}_2$ of two timed automata $\mathcal{A} = (L_1, B_1, X_1, I_1, E_1, f_{in,1})$, $i = 1, 2$, with disjoint sets of clocks X_1 and X_2 yields the timed automaton $\mathcal{A} = (L_1 \times L_2, B_1 \cup B_2, X_1 \cup X_2, I, E, (f_{in,1}, f_{in,2}))$ where

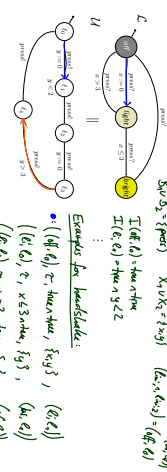

- $I((l_1, l_2)) := I(l_1) \wedge I(l_2)$, and
- E consists of handshake and asynchronous communication.

(\leftarrow next slide)

Parallel Composition: Handshake and Asynchrony

- $\mathcal{A}_1 \parallel \mathcal{A}_2 = (L_1 \times L_2, B_1 \cup B_2, X_1 \cup X_2, I, E, (f_{in,1}, f_{in,2}))$ with
- Handshake:** If there is $\alpha \in B_1 \cup B_2$ such that $(l_1, \alpha, \varphi_1, X_1, l'_1) \in E_1$, and $(\varphi_2, \alpha, \varphi_2, X_2, l'_2) \in E_2$ and $(l_1, \alpha, l'_1) = (l_2, \alpha, l'_2)$, then $((l_1, l_2), \alpha, \varphi_1 \wedge \varphi_2, X_1 \cup X_2, (l'_1, l'_2)) \in E$.
- Asynchrony:** If $(l_1, \alpha, \varphi_1, X_1, l'_1) \in E_1$, then for all $l_2 \in L_2$, $((l_1, l_2), \alpha, \varphi_1, X_1, (l'_1, l_2)) \in E$. If $(l_2, \alpha, \varphi_2, X_2, l'_2) \in E_2$, then for all $l_1 \in L_1$, $((l_1, l_2), \alpha, \varphi_2, X_2, (l_1, l'_2)) \in E$.

Example

- $L = L_1 \times L_2 = \{(l_1, l_2) \mid (l_1, \alpha, \varphi_1, X_1, l'_1) \in E_1 \text{ and } (l_2, \alpha, \varphi_2, X_2, l'_2) \in E_2\}$
- $B_1 \cup B_2 = \{\text{press}\}$, $X_1 \cup X_2 = \{x, y\}$, $(l_2, \alpha, \varphi_2) = (l_1, \alpha, \varphi_1)$
- $I((l_1, l_2)) = I(l_1) \wedge I(l_2)$
- E consists of handshake: $((l_1, l_2), \alpha, \varphi_1 \wedge \varphi_2, X_1 \cup X_2, (l'_1, l'_2))$
- E consists of asynchronous: $((l_1, l_2), \alpha, \varphi_1, X_1, (l'_1, l_2))$ and $((l_1, l_2), \alpha, \varphi_2, X_2, (l_1, l'_2))$

- The complementation function $\bar{\cdot} : Act \rightarrow Act$ is defined pointwise as
 - $\overline{a!} = a?$
 - $\overline{a?} = a!$
 - $\overline{\tau} = \tau$
- Note: $\overline{\overline{\alpha}} = \alpha$ for all $\alpha \in Act$.

Restriction

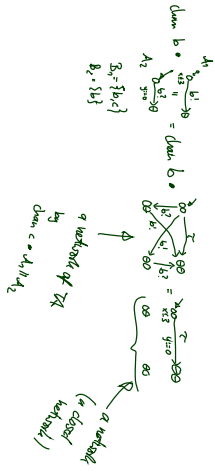

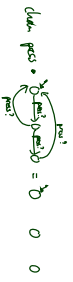

Definition 4.13.
 A local channel b is introduced by the restriction operator which for a timed automaton $\mathcal{A} = (L, B, X, I, E, f_{in})$ yields

channel $\bullet \mathcal{A} := (L, B \setminus \{b\}, X, I, E', f_{in})$

where

- $(l, \alpha, \varphi, X', l') \in E'$
- if and only if $(l, \alpha, \varphi, X', l') \in E$ and $\alpha \notin \{b, b^c\}$

- Abbreviation:** $\text{chan } b_1 \dots b_n \bullet \mathcal{A} := \text{chan } b_1 \bullet \dots \text{chan } b_n \bullet \mathcal{A}$

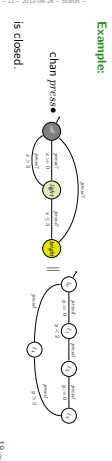

Networks of Timed Automata

- A timed automaton \mathcal{N} is called **network of timed automata** if and only if it is obtained as $\text{chan}^1 \dots \text{chan}^n \bullet (A_1 \parallel \dots \parallel A_n)$

Closed Networks

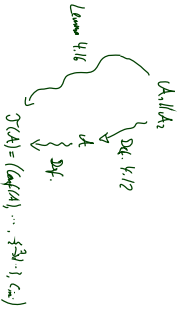

- A network $\mathcal{N} = \text{chan}^1 \dots \text{chan}^n \bullet (A_1 \parallel \dots \parallel A_n)$ is called **closed** if and only if $\{b_1, \dots, b_n\} = \bigcup_{i=1}^n B_i$.
- Then, by Lemma 4.16 (later), **local transitions** don't occur (since $B = \emptyset$). Transitions are thus either **internal actions** τ or **delay transitions**.

Operational Semantics of Networks

Lemma 4.16. Let $A_i = (L_i, B_i, X_i, I_i, E_i, f_{m_i})$ with $i = 1, \dots, n$ be a set of timed automata with disjoint clocks. Then the operational semantics of the network $\text{chan}^1 \dots \text{chan}^n \bullet (A_1 \parallel \dots \parallel A_n)$ yields the labelled transition system $(\text{Conf}(\mathcal{N}), \text{Time} \cup B_{\text{int}}, \{\pm\}, \lambda \in \text{Time} \cup B_{\text{int}}, C_{m_i})$ with

- $X = \bigcup_{i=1}^n X_i$
- $B = \bigcup_{i=1}^n B_i \setminus \{b_1, \dots, b_n\}$
- $\text{Conf}(\mathcal{N}) = \{(\vec{t}, \rho) \mid \vec{t} \in L_1 \times \dots \times L_n, \forall v \in X \rightarrow \text{Time} \cup v \models \bigwedge_{m_i=1}^n I_i(t_i), \text{ where } m_i(x) = 0 \text{ for all } x \in X_i\}$
- and three types of transition relations (— next slides)

Operational Semantics of Networks: Local Transitions

- For each $\lambda \in \text{Time} \cup B_{\text{int}}$, the transition relation $\Delta_{\lambda} \subseteq \text{Conf}(\mathcal{N}) \times \text{Conf}(\mathcal{N})$ has one of the following three types:
- (i) **Local transition:**
- if there is $i \in \{1, \dots, n\}$ such that
- $(t_i, \alpha, \varphi, \gamma, t_i') \in B_i, \alpha \in B_{\text{int}}$ (i -th automaton has corresp. edge)
 - $v' = v$ (guard is satisfied)
 - $\vec{t}' = \vec{t}[t_i := t_i']$ (only i -th location changes)
 - $v' = v[Y := 0]$, and (A_i 's clocks are reset)
 - $v' \models K_i(t_i')$ (destination invariant holds)

(ii) Synchronisation transition:

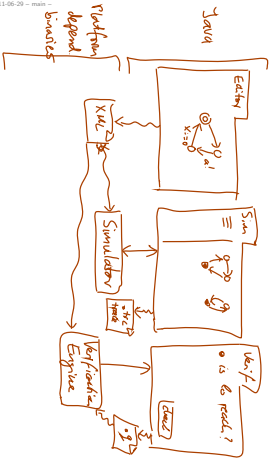

- if there are $i, j \in \{1, \dots, n\}$, $i \neq j$, and $v \in B_i \cap B_j$, such that
 - $(\ell_i, h_i, s_i, Y_i, \ell_j) \in E_i$ and $(\ell_j, h_j, s_j, Y_j, \ell_j) \in E_j$,
 - $v \models \ell_i \wedge s_j$,
 - $\bar{v} = \bar{\ell}_i = \bar{\ell}_j = \bar{\ell}'_i = \bar{\ell}'_j$,
 - $v' = v[\ell_i \cup Y_j := 0]$, and
 - $v' \models \ell_i(\ell_j) \wedge \ell_j(\ell_j)$.

(iii) Delay transition:

- if for all $v' \in [0, \ell]$,
 - $v + v' \models \Lambda_{k=1}^n k_i(\ell_i)$.

Uppaal [Larsen et al., 1997, Behrmann et al., 2004]
