  - Basic Properties
  - Validity, Satisfiability, Realisability
  - *A concrete proof for a gas burner design*

Duration Calculus: Overview

We will introduce three (or five) syntactical "levels":

- (i) **Symbols:**  $f, g, \text{true}, \text{false}; =, <, >, \leq, \geq; x, y, z; X, Y, Z; d$
- (ii) **State Assertions:**  $P ::= () \mid \mid \mid X = d \mid \neg P_1 \mid P_1 \vee P_2$
- (iii) **Terms:**  $\theta ::= x \mid \ell \mid P \mid f(\theta_1, \dots, \theta_n)$
- (iv) **Formulae:**  $F ::= p(\theta_1, \dots, \theta_n) \mid \neg F_1 \mid F_1 \wedge F_2 \mid \forall x \bullet F_1 \mid F_1 ; F_2$
- (v) **Abbreviations:**  $[], [P], [P]^t, [P]^s, \diamond F, \square F$

Formulae: Remarks

**Remark 2.10. [Rigid and chop-free]** Let  $F$  be a duration formula.  $I$  an interpretation,  $\gamma$  a valuation, and  $[k, c] \in \text{Inv}$ .

- If  $F$  is rigid, then  $\forall [k', c'] \in \text{Inv}: \mathcal{I}[F](\gamma, [k, c]) = \mathcal{I}[F](\gamma, [k', c'])$ .
- If  $F$  is chop-free or  $d$  is rigid, then in the calculation of the semantics of  $F$ , every occurrence of  $d$  denotes the same value.

eg.  $\int_0^1 (x-3) \cdot f(x) \cdot 5$

eg.  $\int_0^1 \theta \wedge k > 1$        $\diamond 0; \diamond 1$  not chop-free

Duration Calculus Cont'd

  - *A concrete proof for a gas burner design*

Substitution Lemma

**Lemma 2.11. [Substitution]** Consider a formula  $F$ , a global variable  $x$ , and a term  $\theta$  such that  $F$  is chop-free or  $\theta$  is rigid. Then for all interpretations  $\mathcal{I}$ , valuations  $\gamma$ , and intervals  $[k, c]$ , where  $d = \mathcal{I}[\theta](\gamma, [k, c])$ ,

$\mathcal{I}[F]_x := \theta[\gamma, [k, c]] = \mathcal{I}[F](\gamma, [k, c]) = d$

where  $d = \mathcal{I}[\theta](\gamma, [k, c])$

*synthetic verification / substitution*

$\text{true} = (x = x)$

$F = \int_0^1 (x-3) \cdot f(x) \cdot 5 \Rightarrow \int_0^1 (2-x) \cdot f(x) \cdot 5 = d$        $P, [c, d] = [5, 11]$

$\int \mathcal{I} \pm F \wedge x = \theta[\gamma, [k, c]] = \int \mathcal{I} \mathcal{I} \pm F \wedge x = \theta[\gamma, [k, c]] = d$        $P, [c, d] = [5, 11]$

$\int \mathcal{I} \pm F \wedge (x = c_1) \wedge (x = c_2) = d$        $P, [c, d] = [5, 11]$

$\int \mathcal{I} \pm F \wedge (x = c_1) \wedge (x = c_2) = d$        $P, [c, d] = [5, 11]$

### Validity, Satisfiability, Realisability

Let  $I$  be an interpretation,  $\gamma$  a valuation,  $[b, c]$  an interval and  $F$  a DC formula.

- $I, \gamma, [b, c] \models F$  ("F holds in  $I, \gamma, [b, c]$ ") iff  $\mathcal{I}[F](\gamma, [b, c]) = \text{tt}$ .
- $F$  is called **satisfiable** iff it holds in some  $I, \gamma, [b, c]$ .
- $I, \gamma \models F$  (" $I$  and  $\gamma$  realise  $F$ ") iff  $\forall [b, c] \in \text{Intv} : I, \gamma, [b, c] \models F$ .
- $F$  is called **realisable** iff some  $I$  and  $\gamma$  realise  $F$ .
- $I \models F$  (" $I$  realises  $F$ ") iff  $\forall \gamma \in \text{Val} : I, \gamma \models F$ .
- $\models F$  (" $F$  is valid") iff  $\forall$  interpretation  $I : I \models F$ .

### Validity vs. Satisfiability vs. Realisability

**Remark 2.13.** For all DC formulae  $F$ ,

- $F$  is satisfiable iff  $\neg F$  is not valid.
- $F$  is valid iff  $\neg F$  is not satisfiable.
- If  $F$  is valid then  $F$  is realisable, but not vice versa.
- If  $F$  is realisable then  $F$  is satisfiable, but not vice versa.

### Examples: Valid? Realisable? Satisfiable?

- $I, \gamma, [b, c] \models F$  (" $F$  holds in  $I, \gamma, [b, c]$ ") iff  $\mathcal{I}[F](\gamma, [b, c]) = \text{tt}$ .
- $F$  is called **satisfiable** iff it holds in some  $I, \gamma, [b, c]$ .
- $I, \gamma \models F$  (" $I$  and  $\gamma$  realise  $F$ ") iff  $\forall [b, c] \in \text{Intv} : I, \gamma, [b, c] \models F$ .
- $F$  is called **realisable** iff some  $I$  and  $\gamma$  realise  $F$ .
- $I \models F$  (" $I$  realises  $F$ ") iff  $\forall \gamma \in \text{Val} : I, \gamma \models F$ .
- $\models F$  (" $F$  is valid") iff  $\forall$  interpretation  $I : I \models F$ .

Formula	Satisfiable	Realisable	Valid
$f \geq 0$	✓	✓	✓
$f = 1$	✓	✓	✓
$(f = 30) \iff (f = 10 \vee f = 20)$	✓	✓	✓
$((f; G) : H) \iff (f; (G; H))$	✓	✓	✓
$f \leq x$	✓	✗	✗
$f = 2$	✓	✗	✗
$f < 0$	✗	✗	✗

### Initial Values

- $I, \gamma \models_0 F$  (" $I$  and  $\gamma$  realise  $F$  from 0") iff  $\forall t \in \text{Time} : I, \gamma, [0, t] \models F$ .
- $F$  is called **realisable from 0** iff some  $I$  and  $\gamma$  realise  $F$  from 0.
- Intervals of the form  $[0, t]$  are called **initial intervals**.
- $I \models_0 F$  (" $I$  realises  $F$  from 0") iff  $\forall \gamma \in \text{Val} : I, \gamma \models_0 F$ .
- $\models_0 F$  (" $F$  is valid from 0") iff  $\forall$  interpretation  $I : I \models_0 F$ .

### Initial or not Initial...

For all interpretations  $I$ , valuations  $\gamma$ , and DC formulae  $F$ ,

- $I, \gamma \models F$  implies  $I, \gamma \models_0 F$ , but not vice versa.
- if  $F$  is realisable then  $F$  is realisable from 0, but not vice versa.
- $F$  is valid iff  $F$  is valid from 0.

### Specification and Semantics-based Correctness Proofs of Real-Time Systems with DC

- (i) Choose a collection of **observables**: 'Obs'.
- (ii) Provide the **requirement/specification**: 'Spec' as a conjunction of DC formulas (over 'Obs').
- (iii) Provide a description 'Ctrl' of the **controller** in form of a DC formula (over 'Obs').
- (iv) We say 'Ctrl' is **correct** (wrt. 'Spec') iff  $\models_0 \text{Ctrl} \implies \text{Spec}$

- (i) Choose **observables**:
  - two boolean observables:  $G$  and  $F$  (i.e. Obs =  $\{G, F\}$ ;  $\mathcal{D}(G) = \mathcal{D}(F) = \{0, 1\}$ )
  - $G = \text{t}$ : gas valve open
  - $F = \text{t}$ : have flame
  - define  $L := G \wedge \neg F$  (leakage)
- (ii) Provide the **requirement**:
 
$$\text{Req} := \Box (\ell \geq 60 \implies \exists t_0, l \leq t_0)$$

- (iii) Provide a description 'Ctrl' of the **controller** in form of a DC formula (over 'Obs'). Here, firstly consider a **design**:
  - Des-1:  $\Box (L) \implies \ell \leq 1$
  - Des-2:  $\Box (\Box (L) : \neg L) : \ell > 30 \implies \exists t_0, \ell \leq t_0$
- (iv) Prove **correctness**:
  - We want (or do we want  $\models_{0, \dots, ?}$ ):  $\models \text{Des-1} \wedge \text{Des-2} \implies \text{Req}$

Gas Burner Revisited

- (iii) Provide a description 'Ctrl' of the **controller** in form of a DC formula (over 'Obs'). Here, firstly consider a **design**:
  - Des-1:  $\Box (L) \implies \ell \leq 1$
  - Des-2:  $\Box (\Box (L) : \neg L) : \ell > 30 \implies \exists t_0, \ell \leq t_0$
- (iv) Prove **correctness**:
  - We want (or do we want  $\models_{0, \dots, ?}$ ):  $\models \text{Des-1} \wedge \text{Des-2} \implies \text{Req}$

We do show  $\models \text{Des-1} \wedge \text{Des-2} \implies \text{Req}$  (Thm. 2.16)

We do show  $\models \text{Des-1} \wedge \text{Des-2} \implies \text{Req}$  (Lem. 2.17)

with the simplified requirement  $\text{Req}_1 := \Box (\ell \leq 30 \implies \ell \leq 1)$

and we show  $\models (\text{Des-1} \wedge \text{Des-2}) \implies \text{Req}_1$  (Lem. 2.19) 21/36
