

# Real-Time Systems

## Lecture 7: DC Properties II

2013-05-14

Dr. Bernd Westphal

Albert-Ludwigs-Universität Freiburg, Germany

### Contents & Goals

#### Last Lecture:

- RDC in discrete time
- Stated: Satisfiability and realizability from 0 is decidable for RDC in discrete time

#### This Lecture:

- Educational Objectives: Capabilities for following tasks/questions
- Facts: (un)decidability properties of DC in discrete/continuous time.
  - What's the idea of the considered (un)decidability proofs?
- Content:
  - Complete: Satisfiability and realizability from 0 is decidable for RDC in discrete time
  - Undecidable problems of DC in continuous time

### RDC in Discrete Time Cont'd

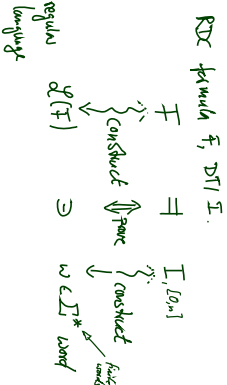

### Recall: Decidability of Satisfiability/Realizability from 0

**Theorem 3.6.**  
The satisfiability problem for RDC with discrete time is decidable.

**Theorem 3.9.**  
The realizability problem for RDC with discrete time is decidable.

4/31

### Recall: Proof Sketch

- 7 - 2013-05-14 - 56e -

5/31

### Sketch: Proof of Theorem 3.6

- give a procedure to construct, given a formula  $F$ , a regular language  $L(F)$  such that
  - $\exists \mathcal{F} \models F$  iff and only if  $w \in L(F)$
 where word  $w$  describes  $\mathcal{F}$  on  $[0, n]$  (satisfiability of the procedure: **Lemma 3.4**)
- then  $F$  is satisfiable in discrete time iff and only if  $L(F)$  is not empty (**Lemma 3.5**)
- Theorem 3.6 follows because
  - $L(F)$  can effectively be constructed,
  - the emptiness problem is decidable for regular languages.

3/31

Construction of  $\mathcal{L}(F)$

- **Idea:**
  - alphabet  $\Sigma(F)$  consists of basic conjuncts of the state variables in  $F$ ,
  - a letter corresponds to an interpretation on an interval of length 1,
  - a word of length  $n$  describes an interpretation on interval  $[0, n]$ .
- **Example:** Assume  $F$  contains exactly state variables  $X, Y, Z$ , then
 
$$\Sigma(F) = \{X \wedge Y \wedge Z, X \wedge Y \wedge \neg Z, X \wedge \neg Y \wedge Z, X \wedge \neg Y \wedge \neg Z, \neg X \wedge Y \wedge Z, \neg X \wedge Y \wedge \neg Z, \neg X \wedge \neg Y \wedge Z, \neg X \wedge \neg Y \wedge \neg Z\}$$

7.19

Sketch: Proof of Theorem 3.9

**Theorem 3.9**  
The realizability problem for RDC with discrete time is decidable.

- $\text{kernel}(L)$  contains all words of  $L$  whose prefixes are again in  $L$ .
  - if  $L$  is regular, then  $\text{kernel}(L)$  is also regular.
  - $\text{kernel}(\mathcal{L}(F))$  can effectively be constructed.
  - We have
- Lemma 3.8.** For all RDC formulae  $F$ ,  $F$  is realizable from 0 in discrete time if and only if  $\text{kernel}(\mathcal{L}(F))$  is infinite.
- Infinity of regular languages is decidable.

11.19

Construction of  $\mathcal{L}(F)$  more Formally

**Definition 3.2.** A word  $w = a_1 \dots a_n \in \Sigma(F)^*$  with  $n \geq 0$  describes a discrete interpretation  $I$  on  $[0, n]$  if and only if

$$\forall j \in \{1, \dots, n\} \forall i \in \{j-1, j\} : \mathbb{I}[a_i][j] = 1.$$

For  $n = 0$  we put  $w = \varepsilon$ .

- Each state assertion  $P$  can be transformed into an equivalent disjunctive normal form  $\bigvee_{i=1}^k a_i$  with  $a_i \in \Sigma(F)$ .
- Set  $DNF(F) := \{a_1, \dots, a_m\} (\subseteq \Sigma(F))$ .
- Define  $\mathcal{L}(F)$  inductively:

$$\begin{aligned} \mathcal{L}(\{P\}) &= DNF(F)^* && \text{(regular language)} \\ \mathcal{L}(\neg F_1) &= \mathcal{L}(F_1)^c && \text{(pointwise complement)} \\ \mathcal{L}(F_1 \vee F_2) &= \mathcal{L}(F_1) \cup \mathcal{L}(F_2) && \text{(union)} \\ \mathcal{L}(F_1 \wedge F_2) &= \mathcal{L}(F_1) \cap \mathcal{L}(F_2) && \text{(intersection)} \end{aligned}$$

8.19

Lemma 3.4

**Lemma 3.4.** For all RDC formulae  $F$ , discrete interpretations  $I$ ,  $n \geq 0$ , and all words  $w \in \Sigma(F)^*$  which describe  $I$  on  $[0, n]$ ,  $I, [0, n] \models F$  if and only if  $w \in \mathcal{L}(F)$ .

**Goal:** Structural induction.  
**Base:**  $F = \{P\}$ . assume  $w = a_1 \dots a_n$ , describes  $I$  on  $[0, n]$ .  
 $\mathbb{I}[a_1] \dots [P] \Leftrightarrow \mathbb{I}[a_1] = 1 \wedge P \Leftrightarrow I, [0, 1] \models P$  and  $n=1$   
 $\Leftrightarrow n=1$  and  $\forall i \in \{1\} : \mathbb{I}[a_i] = 1 \wedge I, [0, 1] \models P$   
**Variables:**  $\Leftrightarrow n=1$  and  $\forall i \in \{1\} : \mathbb{I}[a_i] = 1 \wedge I, [0, 1] \models P$  and  $\forall i \in \text{sub}(P)$   
 $\Leftrightarrow n \in \text{sub}(P)$   
**Show:**  $\rightarrow$  and  $\leftarrow$   
 $\bullet \rightarrow$   
 $\bullet \leftarrow$

9.19

Variants of) RDC in Continuous Time

Recall: Restricted DC (RDC)

$F ::= [P] \mid \neg F_1 \mid F_1 \vee F_2 \mid F_1 \wedge F_2$   
 where  $P$  is a state assertion, but with **boolean** observables only.  
 From now on: "RDC +  $\ell = x, \forall x$ "  
 $F ::= [P] \mid \neg F_1 \mid F_1 \vee F_2 \mid F_1 \wedge F_2 \mid \ell = 1 \mid \ell = x \mid \forall x \bullet F_1$

12.19

13.19

Undecidability of Satisfiability/Realisability from 0

**Theorem 3.10.**  
The realisability from 0 problem for DC with continuous time is undecidable, not even semi-decidable.

**Theorem 3.11.**  
The satisfiability problem for DC with continuous time is undecidable.

Sketch: Proof of Theorem 3.10

Reduce divergence of two-counter machines to realisability from 0:

- Given a two-counter machine  $M$  with final state  $q_{fin}$
- construct a DC formula  $F(M) := encoding(M)$
- such that  $M$  diverges if and only if the DC formula is realisable from 0.

If realisability from 0 was (semi-)decidable, divergence of two-counter machines would be (which it isn't).

ZCM Configurations and Computations

- a configuration of  $M$  is a triple  $K = (q, n_1, n_2) \in \mathbb{Q} \times \mathbb{N}_0 \times \mathbb{N}_0$
- The transition relation  $\rightarrow^c$  on configurations is defined as follows:

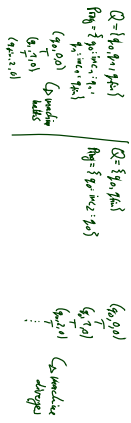

Command	Semantics: $K \rightarrow^c K'$
$q : inc_1 : q'$	$(q, n_1, n_2) \rightarrow (q', n_1 + 1, n_2)$
$q : dec_1 : q'$	$(q, 0, n_2) \rightarrow (q', 0, n_2)$
$q : dec_1 : q'$	$(q, n_1 + 1, n_2) \rightarrow (q', n_1, n_2)$
$q : inc_2 : q'$	$(q, n_1, n_2) \rightarrow (q', n_1, n_2 + 1)$
$q : dec_2 : q'$	$(q, n_1, 0) \rightarrow (q', n_1, 0)$
$q : dec_2 : q'$	$(q, n_1, n_2 + 1) \rightarrow (q', n_1, n_2)$

- The (1) computation of  $M$  is a finite sequence of the form ("M halts")  $K_0 = (q_0, 0, 0) \rightarrow K_1 \rightarrow K_2 \rightarrow \dots \rightarrow (q_{fin}, n_1, n_2)$
- or an infinite sequence of the form ("M diverges")  $K_0 = (q_0, 0, 0) \rightarrow K_1 \rightarrow K_2 \rightarrow \dots$

ZCM Example

- $M = (\mathbb{Q}, inc, prog)$
- commands of the form  $q : inc_i : q'$  and  $q : dec_i : q'$ ,  $i \in \{1, 2\}$
- configuration  $K = (q, n_1, n_2) \in \mathbb{Q} \times \mathbb{N}_0 \times \mathbb{N}_0$

Command	Semantics: $K \rightarrow^c K'$
$q : inc_1 : q'$	$(q, n_1, n_2) \rightarrow (q', n_1 + 1, n_2)$
$q : dec_1 : q'$	$(q, 0, n_2) \rightarrow (q', 0, n_2)$
$q : dec_1 : q'$	$(q, n_1 + 1, n_2) \rightarrow (q', n_1, n_2)$
$q : inc_2 : q'$	$(q, n_1, n_2) \rightarrow (q', n_1, n_2 + 1)$
$q : dec_2 : q'$	$(q, n_1, 0) \rightarrow (q', n_1, 0)$
$q : dec_2 : q'$	$(q, n_1, n_2 + 1) \rightarrow (q', n_1, n_2)$

Recall: Two-counter machines

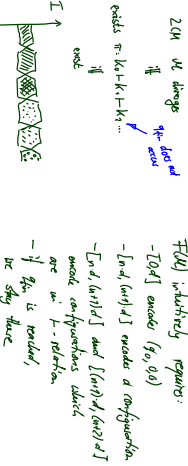

A two-counter machine is a structure

$$M = (\mathbb{Q}, q_0, q_{fin}, Prog)$$

- where  $q_0$  is the initial state and  $q_{fin}$  is the final state
- $Prog$  is the machine program, i.e. a finite set of commands of the form  $q : inc_i : q'$  and  $q : dec_i : q'$ ,  $i \in \{1, 2\}$ .

- We assume deterministic ZCM: for each  $q \in \mathbb{Q}$  at most one command starts in  $q$ , and  $q_{fin}$  is the only state where no command starts.

Reducing Divergence to DC realisability: Idea In Pictures

### Reducing Divergence to DC realizability: Idea

- A single configuration  $K$  of  $\mathcal{M}$  can be encoded in an interval of length 4: Being an encoding interval can be characterized by a DC formula.
- An interpretation on 'Time' encodes a configuration of  $\mathcal{M}$  if
  - each interval  $[n, 4(n+1)]$ ,  $n \in \mathbb{N}_0$ , encodes a configuration  $K_n$ ,
  - each two subsequent intervals  $[n, 4(n+1)]$  and  $[4(n+1), 4(n+2)]$ ,  $n \in \mathbb{N}_0$ , encode configurations  $K_n$  and  $K_{n+1}$  in transition relation.
- Being encoding of the run can be characterized by DC formula  $F(\mathcal{M})$ .
- Then  $\mathcal{M}$  diverges if and only if  $F(\mathcal{M}) \wedge \neg \text{True}$  is realisable from 0.

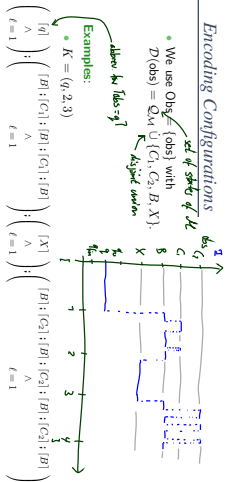

### Initial and General Configurations

$$\text{init} := \text{true} \wedge (\ell \geq 4 \implies [q_0]^\perp; [B]^\perp; [X]^\perp; [B]^\perp; \text{true})$$

$$\text{keep} := \text{true} \wedge \square([q]^\perp; [B \vee G_1]^\perp; [X]^\perp; [B \vee G_2]^\perp; \ell = 4 \implies \ell = 4; [q]^\perp; [B \vee G_1]^\perp; [X]^\perp; [B \vee G_2]^\perp)$$

where  $Q := \neg(X \vee G_1 \vee G_2 \vee B)$ .

### Encoding Configurations

$$K_0 = (q_0, 0, 0) \implies \begin{pmatrix} [q] \\ [B] \\ [X] \end{pmatrix}_{\ell=1} = \begin{pmatrix} [q_0] \\ [B] \\ [X] \end{pmatrix}_{\ell=1} = \begin{pmatrix} [q_0] \\ [B] \\ [X] \end{pmatrix}_{\ell=1}$$

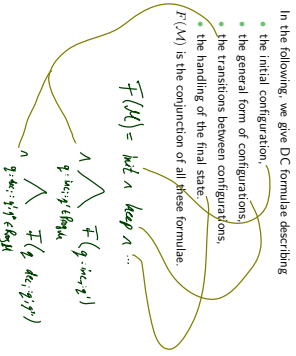

or, using abbreviations,  $[q_0]^\perp; [B]^\perp; [X]^\perp; [B]^\perp$ .

### Auxiliary Formula Pattern Copy

$$\text{copy}(R, \{P_1, \dots, P_n\}) := \bigvee_{c,d} d \bullet \square((P \wedge \ell = c) \wedge ([R \vee \dots \vee P_n] \wedge \ell = d); [P_1]; \ell = 4 \implies \ell = c + d + 4; [P_1])$$

$$\bigwedge_{c,d} d \bullet \square((P \wedge \ell = c) \wedge ([R \vee \dots \vee P_n] \wedge \ell = d); [P_1]; \ell = 4 \implies \ell = c + d + 4; [P_1])$$

### Construction of $F(\mathcal{M})$

### $[q] := \text{true} \wedge [q] \text{ (Increment)} \in R_{\text{copy}}$

(i) Change state

$$\square([q]^\perp; [B \vee G_1]^\perp; [X]^\perp; [B \vee G_2]^\perp; \ell = 4 \implies \ell = 4; [q]^\perp; \text{true})$$

$$\square \left( \begin{array}{c} [q] \\ [B] \\ [X] \\ [G_1] \\ [G_2] \end{array} \right)_{\ell=1} \left( \begin{array}{c} [q] \\ [B] \\ [X] \\ [G_1] \\ [G_2] \end{array} \right)_{\ell=4}$$

(ii) Increment counter

$$\bigvee_{d} d \bullet \square([q]^\perp; [B]^\perp; (\ell = 0 \vee [G_1]^\perp; \neg [X]^\perp); [X]^\perp; [B \vee G_2]^\perp; \ell = 4 \implies \ell = 4; [q]^\perp; ([B]; [G_1]; [B]); \ell = d); \text{true}$$

$q : m_1 : q'$  (Increment)

- (i) Keep rest of first counter  

$$\text{copy}([q]^{-1} : [B \vee C_1] : [C_1], \{B, C_1\})$$

$$\underbrace{\text{copy}([q]^{-1} : [B \vee C_1] : [X]^{-1}, \{B, C_2\})}_{\text{true}}$$
- (ii) Leave second counter unchanged  

$$\underbrace{\text{copy}([q]^{-1} : [B \vee C_1] : [X]^{-1}, \{B, C_2\})}_{\text{true}}$$

26.13

$q : dec_1 : q', q''$  (Decrement)

- (i) If zero  

$$\square([q]^{-1} : [B]^{-1} : [X]^{-1} : [B \vee C_2]^{-1} : \ell = 4 \implies \ell = 4 : [q]^{-1} : [B]^{-1} : true)$$
- (ii) Decrement counter  

$$\forall \ell \bullet \square([q]^{-1} : [B]^{-1} : [C_1] \wedge \ell = 0) : [B]^{-1} : [B \vee C_1] : [X]^{-1} : [B \vee C_2]^{-1} : \ell = 4$$

$$\implies \ell = 4 : [q]^{-1} : [B]^{-1} : true$$

- (iii) Keep rest of first counter  

$$\text{copy}([q]^{-1} : [B]^{-1} : [C_1] : [B_1] : [B, C_1])$$
- (iv) Leave second counter unchanged  

$$\text{copy}([q]^{-1} : [B \vee C_1] : [X]^{-1}, \{B, C_2\})$$

27.13

Final State

$$\text{copy}([q_{\text{final}}]^{-1} : [B \vee C_1]^{-1} : [X]^{-1} : [B \vee C_2]^{-1} : \{q_{\text{final}}, B, X, C_1, C_2\})$$

28.13

### Satisfiability

- Following [Chaochen and Hansen, 2004] we can observe that  $\mathcal{M}$  halts if and only if the DC formula  $F(\mathcal{M}) \wedge \neg \langle q_{\text{final}} \rangle$  is satisfiable. This yields

**Theorem 3.11.** The satisfiability problem for DC with continuous time is undecidable.

(It is semi-decidable.)

- Furthermore, by taking the contraposition, we see  $\mathcal{M}$  diverges if and only if  $\mathcal{M}$  does not halt if and only if  $F(\mathcal{M}) \wedge \neg \langle q_{\text{final}} \rangle$  is not satisfiable.
- Thus whether a DC formula is not satisfiable is not decidable, not even semi-decidable.

29.13

### Validity

- By Remark 2.13,  $F$  is valid iff  $\neg F$  is not satisfiable, so

**Corollary 3.12.** The validity problem for DC with continuous time is undecidable, not even semi-decidable.

- This provides us with an alternative proof of Theorem 2.23 ("there is no sound and complete proof system for DC").
- Suppose** there were such a calculus  $C$ .
- By Lemma 2.22 it is semi-decidable whether a given DC formula  $F$  is a theorem in  $C$ .
- By the soundness and completeness of  $C$ ,  $F$  is a theorem in  $C$  if and only if  $F$  is valid.
- Thus it is semi-decidable whether  $F$  is valid. **Contradiction.**

30.13

### Discussion

- Note: the DC fragment defined by the following grammar is sufficient for the reduction  

$$F ::= |P| \neg F_1 \mid F_1 \vee F_2 \mid F_1 : F_2 \mid \ell = 1 \mid \ell = x \mid \forall x \bullet F_1,$$
 $P$  a state assertion,  $x$  a global variable.

- Formulae used in the reduction are abbreviations:

$$\ell = 4 \iff \ell = 1; \ell = 1; \ell = 1; \ell = 1; \ell = 1$$

$$\ell \geq 4 \iff \ell = 4; true$$

$$\ell = x + y + 4 \iff \ell = x; \ell = y; \ell = 4$$

- Length 1 is not necessary — we can use  $\ell = x$  instead, with fresh  $z$ .
- This is RDC augmented by " $\ell = x$ " and " $\forall x, z$ ", which we denote by **RDC +  $\ell = x, \forall x, z$** .
