

Formal Methods for C

Seminar – Summer Semester 2014

Daniel Dietsch, Sergio Feo Arenis, Marius Greitschus, **Bernd Westphal**

– 2014-04 – main –

Plan

- (15 min.) Topic lottery: prepare lottery ticket with
 - name *19.5.*
 - first preference topic
 - second preference topic
- ▶ Introduction to C (1)
 - (15 min.) The VM (Marius)

– 2014-04 – plan –

Overview

Goals

Educational Objectives: Capabilities for following tasks/questions.

- Rough overview over concepts of the C programming language.
 - IOW: know, what to look for in books/manuals.
(We try to stick with the names from of ISO/IEC 9899:1999.)
 - IOW: don't be badly surprised from the examples.
- The concept of pointers.
- Basic work-flow, tool-usage (headers, sources, compiler, linker).
- Orthogonal: Rough overview over common sources of errors.
- Formal methods and C.
- **Not:** reference manual, each and every feature.
- **Not:** programming course.

source C	"good"	source C++	source C#
N-1	3	0	0

$f(i, i)$

Everybody Say “Hello” to C

```
1 #include <stdio.h>
2
3 int g( int x ) {
4     return x/2;
5 }
6
7 int f() {
8     return g(1);
9 }
10
11 int main() {
12     printf( " Hello World.\n" );
13     return f();
14 }
```

42 Years of C

1972: Created by **Dennis Ritchie** († 2011) for Unix system programming.

1978: Brian W. Kernighan & Dennis Ritchie:
“The C Programming Language” – “K&R C”,

1989: ANSI X3.159-1989 – C89, **C90** (still most widely used (?))

1999: ISO/IEC 9899:1999 – C99, (use `--std=c99` for `gcc(1)`)

2011: ISO/IEC 9899:2011 – C11

42 Years of C

1972: Created by **Dennis Ritchie** († 2011) for Unix system programming.

1978: Brian W. Kernighan & Dennis Ritchie:
“The C Programming Language” – “K&R C”,

1989: ANSI X3.159-1989 – C89, **C90** (still most widely used (?))

1999: ISO/IEC 9899:1999 – C99, (use `--std=c99` for `gcc(1)`)

2011: ISO/IEC 9899:2011 – C11

- Compilers for virtually every platform (CPU + operating system) available. Virtually every CPU vendor offers an own C compiler, in particular in the embedded domain (MSP 430, ARM, intel...).
- Still No. 1 programming language for embedded systems software, hardware drivers, performance critical applications, ...
- Preferred by many embedded programmers for “lack of surprises”: (without optimisation) direct correspondence between C code and assembler.
- Resources widely controllable by programmer, downside: programmer needs to “know what one’s doing”

Content

- Brief history ✓
- Comments
- Declarations and Scopes
 - Variables
 - Expressions and Statements
 - Functions
 - Scopes
- Pointers
- Dynamic Storage & Storage Duration
- Storage Class Specifiers
- Strings and I/O
- Tools & Modules
- Formal Methods for C
- Common Errors

– 2014-04 – overview –

7/120

Comments

Comments (6.5.9)

- one line comment, until end of line: `// ...`
- generic comment, no nesting: `/* ... */`
- corner cases:

```
1 "a//b"           // four-character string literal
2 #include "//e"   // undefined behavior
3 // */           // comment, not syntax error
4 f = g/**//h;    // equivalent to f = g / h;
5 /\
6 i();            // part of a two-line comment
7 \
8 / j();          // part of a two-line comment
9 #define glue(x,y) x##y
10 glue(/,/ ) k(); // syntax error, not comment
11 /*/**/ l();     // equivalent to l();
12 m = n/**//o
13 + p;            // equivalent to m = n + p;
```

Declarations and Scopes

Variables

Basic Types (6.2.5), Constants (6.4.4)

```
1 char c = 'a', d = 93;
2
3 int x = 027; // octal!
4 long int y = 3L, z;
5 short int w = 0xBEEF;
```

“[...] **char** is large enough to store any member of the basic exec. character set.”

“A ‘plain’ **int** object has the natural size suggested by the architecture of the execution environment (large enough [for values] **INT_MIN** to **INT_MAX**).”

```
1 unsigned int x = 27U;
```

char, short int, int, long int, long long int also as **unsigned**.

```
1 float f = 1;
2 double g = 314159e-5;
3 long double h;
```

– 2014-04 – decl –

12/120

Bool (6.2.5)

- Only introduced in C99.
- “An object declared as type **_Bool** is large enough to store the values 0 and 1.”
- `<stdbool.h>` (→ later) defines **bool**, **true**, **false** as macros (→ later).
- Before C99, and **still very common**:
 - Use scalar type (including pointers).
 - **0: false**
 - **everything else: true**
 - values of boolean expressions: 0, 1

```
1 int y = 27;
2 int x = 13 && (y > 0); // value of x becomes 1
```

– 2014-04 – decl –

13/120

Derived Types (6.2.5), (6.7)

- **array types:**

```
1 int a[10];
2 char b[2][3];
```

- **structured types:**

```
1 typedef (struct {
2     int n;
3     double d;
4 })S; // declaration of type 'S'
5
6 S x; // declaration of variable 'x' of type 'S'
7
8 struct { int a; double b; } y; // declaration of...?
9 typedef (struct { S[3] c; double d; })T;
```

Note: *x* and *y* are of different type!

- **union types:** not here
- **function types, pointer types:** later

– 2014-04 – decl –

14/120

Declaration Syntax

- ...takes a little bit getting used to:

```
1 int c, *p, a[3], *q[2], (*f)(int);
```

- is a shorthand notation for:

```
1 int c; // integer
2 int *p; // pointer to integer
3 int a[3]; // array of 3 integers
4 int *q[2]; // array of 2 pointers to integer
5 int (*f)(int); // function pointer...
```

- And what's declared here, what is its type?

```
1 int (*g)( int (*)(int*[2]) ); // ...?
```

– 2014-04 – decl –

15/120

Expressions

Expressions (6.5)

- “An **expression** is a sequence of operators and operands that specifies computation of a value, or that designates an object or a function, or that generates side effects, or that performs a combination thereof.”

- basically like Java:

- postfix operators:
- unary operators:
- cast operators:
- multiplicative, additive
- relational, equality:
- logical operators:
- conditional operator:
- assignment operator (are expressions!):
- comma operator:

address of *dereference*

a++, p.x, q->y

++a, sizeof(int), &a, *p

(double)a

type *e.g. int*

a < b, a == b, a != b

(a < b) && (c > 0)

a < b ? a : b

a = b, a += b, a = b = 0

a = b, c = d

Boolean Logic (6.3.2.1, 6.5.13–6.5.15)

- “When any scalar value is converted to `_Bool`, the result is 0 [**false**] if the value compares equal to 0; otherwise, the result is 1.” (6.3.2.1)
- $(a != 0)$ and `!a` are equivalent (if `a` is of scalar type), so are $(a == 0)$ and `!a`
- for pointers (later): $p == \text{NULL}$ and `!p` are equivalent

– 2014-04 – expr –

18/120

Bitwise Operators (6.5.3.3, 6.5.7, 6.5.10–12)

- Often used in hardware level programming:
Communicate with “the hardware” via memory-mapped registers – single bits or groups of bits have particular, platform dependent meaning.

- Bitwise And, Or, Xor (6.5.10-12):

$$\begin{array}{l} 0101_2 \ \& \ 1100_2 \ == \ 0100_2 \\ 0101_2 \ \&\& \ 1100_2 \ == \ 0001_2 \end{array}$$

Handwritten notes: "bitwise" above the first line, "false" above the second line.

- Useful idioms (assuming 4-bit type):

- Set the 3rd bit: `a |= 01002`
- Clear the 2nd bit: `a &= 11012`
- Test whether 2nd bit set: `a & 00102`

- Shift (6.5.7): `a << 2`, `a >> 2`
(unsigned (!) filled up with 0 at left and right)
- Bitwise complement (6.5.3.3): `~a`

Be careful with signed types (bit-operations at best on unsigned):

`~(int(1)) == 0xFFFFFFFFE // == -2`

– 2014-04 – expr –

19/120

Lvalues (6.3.2.1)

```
1  int x, a[3], *p;  
2  
3  x = 27;  
4  a[1] = 0;  
5  p = &x;  
6  *p = 13;  
7  
8  &x = ...; // no  
9  a = ...; // no, only as initializer
```

- “An **lvalue** is an expression with an object type or an incomplete type other than void;”
- “The name “lvalue” [comes from] $E1 = E2$, in which the **left** operand $E1$ is required to be a (modifiable) lvalue.
What is sometimes called “rvalue” is in this International Standard described as the “value of an expression”.
An obvious example of an lvalue is an identifier of an object.”

– 2014-04 – expr –

20/120

Statements

– 2014-04 – stm –

21/120

Statements (6.8)

- “A **statement** specifies an action to be performed. Except as indicated, statements are executed in sequence.”
- also basically like Java:
 - Selection statements (6.8.4): `if, else, switch`
 - Iteration statements (6.8.5): `while, do ... while, for`
 - Jump statements (6.8.6): `goto, continue, break, return`

Functions

Function Definitions (6.9.1)

```
1 int max( int a, int b )
2 {
3     return a > b ? a : b;
4 }
```

decl. + def.

- no nesting, no member functions
- all in file (global) scope (but: module scope possible (**later**))
- call-by-value semantics (call-by-reference: **later**)

Function declaration (vs. **definition**):

```
1 int max( int a, int b ); // param. names just "decoration"
2 int max( int, int );
```

- 2014-04 - functions -

- ^{only-} "Zero or many declarations, exactly one definition."

24/120

Scopes

- 2014-04 - scope -

25/120

Scopes of Identifiers (6.2.1)

```
1 int a; // file scope (F)
2
3 struct { int a; } s; // name-space
4
5 int f( int a ) // block scope, block (A)
6 { /* ← (A) */
7   if ( a ) { /* ← (B) */
8     a = 0; // uses a:(A)
9
10    int a = 27; // block scope, block (B)
11
12    s.a = a; // uses a:(B)
13  }
14  return a; // uses a:(A)
15 }
16
17 int main() { return f(a); /* uses a:(F) */ }
```

in older
versions
not allowed
here;
must be
there
then

- 2014-04 - scope -

- “The same identifier can denote different entities at diff. points in the program.”
- “For each different entity that an identifier designates, the identifier is **visible** (i.e., can be used) only within a region of program text called its **scope**.”

26/120

Scopes of Identifiers (6.2.1)

- “**Different entities** designated by the **same identifier** either have different scopes, or are in different name spaces.

There are four kinds of scopes:

function, file, block, and function prototype.”

- “A label name is the only kind of identifier that has function scope.”
- “Every other identifier has scope determined by the placement of its declaration (in a declarator or type specifier).”

- **Declare before use:**

each identifier must be declared before (i.e. earlier in the source file) its first use in, e.g., an expression. (**Unlike Java!**)

NO: *no a here*

```
f() {
  a = 27;
  int a;
}
```

Java:

```
class C {
  int f() {
    a = 27; return 0;
  }
  int a;
}
```

- 2014-04 - scope -

27/120

Scopes of Identifiers (6.2.1)

- “**Different entities** designated by the **same identifier** either have different scopes, or are in different name spaces.
There are four kinds of scopes: function, file, block, and function prototype.”
- “A label name is the only kind of identifier that has function scope.”
- “Every other identifier has scope determined by the placement of its declaration (in a declarator or type specifier).”
- **Declare before use:**
each identifier must be declared before (i.e. earlier in the source file) its first use in, e.g., an expression. (**Unlike Java!**)
- “**Hidden**” identifiers are not accessible:

```
1 int a; /* (F) */
2
3 void f( int a ) { /* (A) */
4     a = 0; // uses a:(A),
5             // a:(F) not accessible here, "hidden" by a:(A)
6 }
```

– 2014-04 – scope –

27/120

Pointers

– 2014-04 – pointers –

28/120

Variables in the System's Memory

```
1 char c = 127;
```

the compiler chose to store values of 'c' at memory cell with address 0x1001

0x1000	0x1001	0x1002	0x1003	...				
	0x7F							
0x1008	0x1009	0x100A	0x100B	0x100C	0x100D	0x100E	0x100F	
0x1010	0x1011	0x1012	0x1013	0x1014	0x1015	0x1016	0x1017	
				...				

- 2014-04 - pointers -

29/120

Assigning Variables = Update Memory

```
1 char c = 127;  
2 c = c + 1;
```

" $c = c + 1$ " means: the new value of c is the old value plus 1; in assembler:
read 0x1001,R; inc R;
write R,0x1001

0x1000	0x1001	0x1002	0x1003	...				
	0x7F							
0x1008	0x1009	0x100A	0x100B	0x100C	0x100D	0x100E	0x100F	
0x1010	0x1011	0x1012	0x1013	0x1014	0x1015	0x1016	0x1017	
				...				

- 2014-04 - pointers -

30/120

Assigning Variables = Update Memory

```
1 char c = 127;  
2 c = c + 1;
```

“ $c = c + 1$ ” means: the new value of c is the old value plus 1; in assembler:
read $0x1001, R$; inc R ;
write $R, 0x1001$

...							
0x1000	0x1001 0x80	0x1002	0x1003	0x1004	0x1005	0x1006	0x1007
0x1008	0x1009	0x100A	0x100B	0x100C	0x100D	0x100E	0x100F
0x1010	0x1011	0x1012	0x1013	0x1014	0x1015	0x1016	0x1017
				...			

– 2014-04 – pointers –

30/120

A Pointer to ‘c’ (16-bit Architecture)

```
1 char c = 127;  
2 c = c + 1;  
3 char* p = &c;
```

the compiler chose to store values of variable ‘p’ at memory cells (!) with addresses 0x1002 and 0x1003

...							
0x1000	0x1001 0x80	0x1002 0x10	0x1003 0x01	0x1004	0x1005	0x1006	0x1007
0x1008	0x1009	0x100A	0x100B	0x100C	0x100D	0x100E	0x100F
0x1010	0x1011	0x1012	0x1013	0x1014	0x1015	0x1016	0x1017
				...			

– 2014-04 – pointers –

31/120

Dereferencing Pointers

```
1 char c = 127;  
2 c = c + 1;  
3 char* p = &c;  
4 *p = *p + 3;
```

dereference

0x1000	0x1001	0x1002	...	0x1003	0x1004	0x1005	0x1006	0x1007
	0x80	0x10	0x01					
0x1008	0x1009	0x100A	0x100B	0x100C	0x100D	0x100E	0x100F

Pointers vs. Arrays

Arrays

```
1 char a[5] = { 'H', 'e', 'l', 'l', 'o' };
```

Arrays

reserve some space
for 5 chars...

```
1 char a[5] = { 'H', 'e', 'l', 'l', 'o' };
```

...and let **a** point
to that space

Arrays

reserve some space
for 5 chars...

```
1 char a[5] = { 'H', 'e', 'l', 'l', 'o' };
```

...and let **a** point
to that space

Arrays

```
1 char a[5] = { 'H', 'e', 'l', 'l', 'o' };  
2 int i;  
3 for (i = 0; i < 5; ++i)  
4   a[i] = 'x';
```

2 int* p = a;
3 void* q = a;
4 for (int i = 0; i < 3; ++i) {
5     p++;
6     q++;
7 }
```

- 2014-04 - pointers -

44/120

Pointers: Observation

- A variable of pointer type just **stores an address**.
- So do variables of **array type**.
- Pointers can point to a certain type, or to **void**.
- "A pointer to void shall have the same representation and alignment requirements as a pointer to a character type." (6.2.5.26)
- The effect of "incrementing" a pointer depends on the type pointed to.

```
1 int a[2];
2 int* p = a;
3 ++p; // points to a[1]
4 void* q = a;
5 q += sizeof(int); // points to a[1]
6 ++q; // may point into the middle
```

- 2014-04 - pointers -

45/120

Pointer Arithmetic

```
1 int[3] a = { 10, 010, 0x1234 }, i = 0;
2
3 int* p = a; // not &a !
4
5 if (a[0] == *p) i++;
6 if (a[1] == *(p+1)) i++;
7 if (a[2] == *(p+2)) i++;
8
9 if (&a[2] - p == 2) i++;
10
11 void* q = a;
12
13 if (a[2] == *((int*)(q + (2 * sizeof(int)))) i++;
14
15 // i = 5
```

void as such does not have values, we need to **cast** 'q' here... note: **void*** can be casted to everything

Pointers for Call By Reference

Call By Reference with Pointers

```

1 void f( int x, int y ) {
2     x++, y++;
3 }
4 void g( int* p, int* q ) {
5     (*p)++, (*q)++;
6 }
7 int a = 2, b = 5;
8 f( a, b );
9 g( &a, &b );

Dynamic Storage Management

Dynamic Storage Allocation:

- void* **malloc**(size_t size);
“[...] allocates **size** bytes and returns a pointer to the allocated memory.
The memory is not initialized. [...]”
- “On error, [this function] returns NULL.”

Dynamic Storage Management

Dynamic Storage Allocation:

- void* **malloc**(size_t size);
“[...] allocates **size** bytes and returns a pointer to the allocated memory.
The memory is not initialized. [...]”
- “On error, [this function] returns NULL.”

- void **free**(void* ptr)
“[...] frees the memory space pointed to by **ptr**, which **must** have been returned by a previous call to malloc(), [...]”
- “Otherwise, or if **free(ptr)** has already been called before, **undefined behavior** occurs.”
- “If **ptr** is **NULL**, no operation is performed.”

Dynamic Storage Management

Dynamic Storage Allocation:

- void* **malloc**(size_t size);
“[...] allocates **size** bytes and returns a pointer to the allocated memory.
The memory is not initialized. [...]”
- “On error, [this function] returns NULL.”
- void **free**(void* ptr)
“[...] frees the memory space pointed to by **ptr**, which **must** have been returned by a previous call to malloc(), [...].”
- “Otherwise, or if **free(ptr)** has already been called before, **undefined behavior** occurs.”
- “If **ptr** is **NULL**, no operation is performed.”
- **No garbage collection!**
Management of dynamic storage is **responsibility of the programmer**.
Unaccessible, not free'd memory is called **memory leak**.

56/120

Storage Duration of Objects

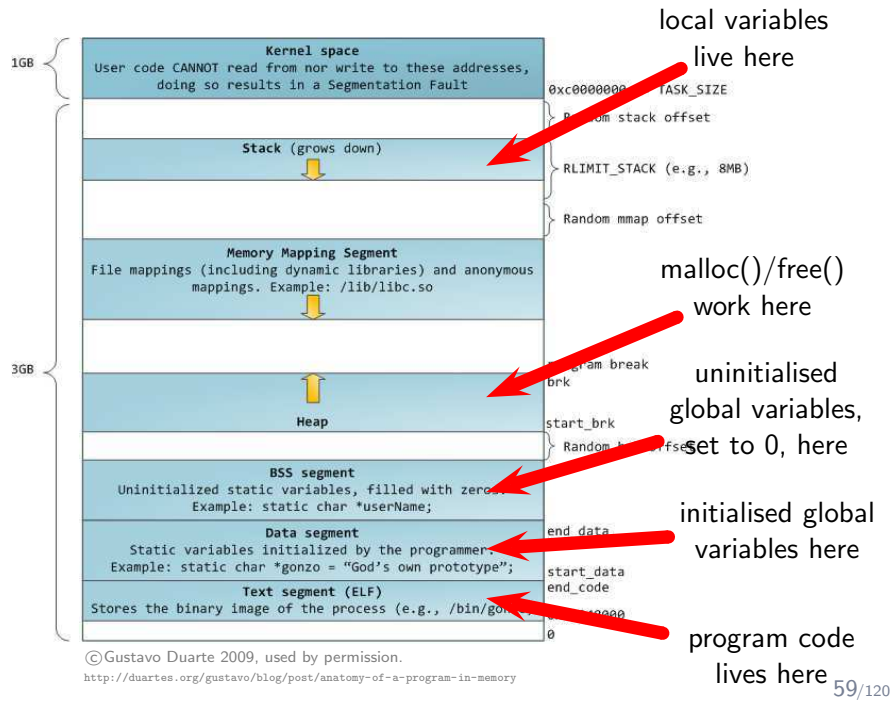

Storage Duration of Objects (6.2.4)

- **“static”** – e.g. variables in program scope:
 - live from program start to end
 - if not explicitly initialized, set to 0 (6.7.8)
- **“automatic”** – non-static variables in local scope:
 - live from block entry to exit
 - not automatically initialised: “initial value [...] is indeterminate”
- **“allocated”** – dynamic objects:
 - live from **malloc** to **free**
 - not automatically initialised

“If an object is referred to outside of its lifetime, **the behavior is undefined.**”

The value of a pointer becomes indeterminate when the object it points to reaches the end of its lifetime.”

Example: Anatomy of a Linux Program in Memory

- 2014-04 - storage -

Storage Duration “Automatic” (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

... p b a

60/120

Storage Duration “Automatic” (Simplified)

```
1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;
```

p refers to a non-alive object, the behavior is undefined (everything **may happen**, from ‘crash’ to ‘ignore’).

60/120

Storage Classes and Qualifiers

- 2014-04 - modifiers -

61/120

Storage Class Specifiers (6.7.1)

Storage Class Specifiers (6.7.1)

```
1  typedef char letter;  
2  
3  extern int x;  
4  extern int f();  
5  
6  static int x; // two uses! (-> later)  
7  static int f();  
8  
9  
10 auto x; // "historic"  
11  
12 register y; // "historic"
```

Storage Class Specifiers: *extern* (6.7.1)

```
1 // not _defined_ here, "imported"...
2 //
3 extern int x;
4 extern void f();
5
6 // declared _and_ defined here, "exported" ...
7 //
8 int y;
9
10 int g() {
11     x = y = 27;
12     f();
13 }
```

- 2014-04 - modifiers -

- → modules, linking (later)
- usually only *extern* in headers (later)

64/120

Storage Class Specifiers: *static* (6.7.1)

```
1 // declared _and_ defined here,
2 // _not_ "exported" ...
3 //
4 static int x;
5 static void g();
6
7
8 int f() {
9     static int a = 0;
10    a++;
11    printf( "%s\n", a );
12 }
13
14 f(); f(); f(); // yields 1, 2, 3
```

- 2014-04 - modifiers -

65/120

Qualifiers (6.7.3)

Qualifiers (6.7.3)

```
1 int x;  
2  
3 const int y;  
4  
5 volatile int z;  
6  
7 int* restrict p; // aliasing  
8  
9  
10 const volatile int a;
```

Qualifiers (6.7.3)

```
1 int x;  
2  
3 const int y;  
4  
5 volatile int z;  
6  
7 int* restrict p; // aliasing  
8  
9  
10 const volatile int a;
```

restrict:

- “[... lengthy formal definition ...]”
- “[...] If these requirements are not met, then the behavior is **undefined**.”
- → use **extremely carefully** (i.e. if in doubt, not at all)

68/120

Excursion: Memory Mapped I/O

- **Intuition:** some memory addresses are wired to hardware
 - **writing** to the address causes a pin to change logical value
 - **reading** the address gives logical value of a pin

- 2014-04 - modifiers -

68/120

Excursion: Memory Mapped I/O

- **Intuition:** some memory addresses are wired to hardware
 - **writing** to the address causes a pin to change logical value
 - **reading** the address gives logical value of a pin

- 2014-04 - modifiers -

68/120

Excursion: Memory Mapped I/O

- **Intuition:** some memory addresses are wired to hardware
 - **writing** to the address causes a pin to change logical value
 - **reading** the address gives logical value of a pin

- 2014-04 - modifiers -

- The compiler does not know, "**memory is memory**".

68/120

Qualifiers: *volatile* (6.7.3)

```
1 volatile char* out = 0x1006;  
2 volatile char* in = 0x1007;  
3  
4 out = 0x01; // switch lamp on  
5  
6 if (in & 0x01) { /* ... */ }  
7  
8 if ((in & 0x01) && (in & 0x01)) { /* ... */ }
```

Strings & Input/Output

Strings

Strings are 0-Terminated *char* Arrays

```
1 char* msg = "Hello";  
2 char* str = msg;
```

Strings are 0-Terminated *char* Arrays

```
1 char* msg = "Hello";  
2 char* str = msg;
```

- 2014-04 - stringsandio -

72/120

String Manipulation (Annex B)

```
# include<string.h>  
provides among others:
```

- 2014-04 - stringsandio -

73/120

String Manipulation (Annex B)

include<string.h>

provides among others:

- size_t **strlen**(const char* s)
“[...] calculates length of string s, excluding **the terminating null byte** ('\0').”

String Manipulation (Annex B)

include<string.h>

provides among others:

- size_t **strlen**(const char* s)
“[...] calculates length of string s, excluding **the terminating null byte** ('\0').”
- int **strcmp**(const char* s1, const char* s2)
“[...] compares the two strings s1 and s2.
It returns an integer less than, equal to, or greater than zero if s1 is found, respectively, to be less than, to match, or be greater than s2.”

String Manipulation (Annex B)

include<string.h>

provides among others:

- size_t **strlen**(const char* s)
“[...] calculates length of string s, excluding **the terminating null byte** ('\0’).”
- int **strcmp**(const char* s1, const char* s2)
“[...] compares the two strings s1 and s2.
It returns an integer less than, equal to, or greater than zero if s1 is found, respectively, to be less than, to match, or be greater than s2.”
- char* **strcpy**(char* s1, const char* s2)
“The strcpy() function copies the string pointed to by s2, including **the terminating null byte** ('\0’), to the buffer pointed to by s1.”

String Manipulation (Annex B)

include<string.h>

provides among others:

- size_t **strlen**(const char* s)
“[...] calculates length of string s, excluding **the terminating null byte** ('\0’).”
- int **strcmp**(const char* s1, const char* s2)
“[...] compares the two strings s1 and s2.
It returns an integer less than, equal to, or greater than zero if s1 is found, respectively, to be less than, to match, or be greater than s2.”
- char* **strcpy**(char* s1, const char* s2)
“The strcpy() function copies the string pointed to by s2, including **the terminating null byte** ('\0’), to the buffer pointed to by s1.”
- char* **strncpy**(char* s1, const char* s2, size_t n)

None of these functions allocates memory!

String Manipulation (Annex B)

include<string.h>

provides among others:

- `size_t strlen(const char* s)`
“[...] calculates length of string s, excluding **the terminating null byte** ('\0').”
- `int strcmp(const char* s1, const char* s2)`
“[...] compares the two strings s1 and s2.
It returns an integer less than, equal to, or greater than zero if s1 is found, respectively, to be less than, to match, or be greater than s2.”
- `char* strcpy(char* s1, const char* s2)`
“The strcpy() function copies the string pointed to by s2, including **the terminating null byte** ('\0'), to the buffer pointed to by s1.”
- `char* strncpy(char* s1, const char* s2, size_t n)`

None of these functions allocates memory!

Allocate and copy: (not C99, but POSIX)

- `char* strdup(const char* s)`

Input/Output

Printing

```
1 #include <stdio.h>
2
3 printf( "%s %i %f\n", " Hello", 27, 3.14 );
```

Tools & Modules

Hello, Again

```
1 #include <stdio.h>
2
3 int g( int x ) { return x/2; }
4
5 int f() { return g(1); }
6
7 int main() {
8     printf( "Hello World.\n" );
9     return f();
10 }
```

- % gcc helloworld.c
- % ls
- a.out helloworld.c
- % ./a.out
- Hello World.

Compiler

`gcc [OPTION]... infile...`

`-E` – preprocess only

`-c` – compile only, don't link

Example: `gcc -c main.c` — produces `main.o`

`-o outfile` – write output to **outfile**

Example: `gcc -c -o x.o main.c` — produces `x.o`

`-g` – add debug information

`-W, -Wall, ...` – enable warnings

`-I dir` – add **dir** to **include path** for searching headers

`-L dir` – add **dir** to **library path** for searching libraries

`-D macro[=defn]` – define **macro** (to **defn**)

Example: `gcc -DDEBUG -DMAGICNUMBER=27`

`-l library` link against `liblibrary.{a,so}`, order matters

Example: `gcc a.o b.o main.o -lxy`

- 2014-04 - tools -

→ cf. `man gcc`

84/120

gdb(1), ddd(1), nm(1), make(1)

- **Command Line Debugger:**

```
gdb a.out [core]
```

- **GUI Debugger:**

```
ddd a.out [core]
```

(works best with debugging information compiled in (gcc -g))

- **Inspect Object Files:**

```
nm a.o
```

- **Build Utility:**

```
make
```

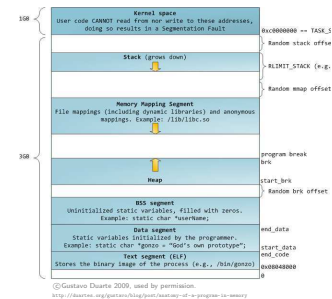

See battery controller exercise for an example.

Formal Methods for C

- 2014-04 - assert -

87/120

Correctness and Requirements

Correctness

- Correctness is defined **with respect to** a specification.
- A program (function, ...) is **correct** (wrt. specification φ)
if and only if it satisfies φ .
- Definition of “satisfies”: **in a minute**.

Examples:

- φ_1 : the return value is 10 divided by parameter (if parameter not 0)
- φ_2 : the value of variable x is “always” strictly greater than 3
- φ_3 : the value of i increases in each loop iteration
- ...

- **State Invariants:**
 - “at **this** program point, the value of p must not be NULL”
 - “at **all** program points, the value of p must not be NULL”
 - (cf. **sequence points** (Annex C))
- **Data Invariants:**
 - “the value of n must be the length of s ”
- **(Function) Pre/Post Conditions:**
 - Pre-Condition: the parameter must not be 0
 - Post-Condition: the return value is 10 divided by the parameter
- **Loop Invariants:**
 - “the value of i is between 0 and array length minus 1”

*Poor Man’s Requirements Specification

```
1 #include <assert.h>
2 void assert( /* scalar */ expression );
```

- “The assert macro puts diagnostic tests into programs; [...]

When it is executed, if `expression` (which shall have a scalar type) is false (that is, compares equal to 0), the assert macro

- writes information about the particular call that failed [...] on the standard error stream in an implementation-defined format.
- It then calls the `abort` function.”

– 2014-04 – assert –

92/120

Diagnostics (7.2)

```
1 #include <assert.h>
2 void assert( /* scalar */ expression );
```

- “The assert macro puts diagnostic tests into programs; [...]

When it is executed, if `expression` (which shall have a scalar type) is false (that is, compares equal to 0), the assert macro

- writes information about the particular call that failed [...] on the standard error stream in an implementation-defined format.
- It then calls the **abort** function.”

Pitfall:

- If macro `NDEBUG` is **defined** when including `<assert.h>`, `expression` **is not evaluated** (thus should be side-effect free).

– 2014-04 – assert –

92/120

abort (7.20.4.1)

```
1 #include <stdlib.h>
2
3 void abort();
```

- “The abort function causes abnormal program termination to occur, unless [...]
- [...] An implementation-defined form of the status unsuccessful termination is returned to the host environment by means of the function call `raise(SIGABRT)`.”

(→ Core Dumps)

– 2014-04 – assert –

93/120

Common Patterns with *assert*

- **State Invariants:**
 - “at **this** program point, the value of p must not be NULL”
 - “at **all** program points, the value of p must not be NULL”
(cf. **sequence points** (Annex C))
- **Data Invariants:**
 - “the value of n must be the length of s ”
- **(Function) Pre/Post Conditions:**
 - Pre-Condition: the parameter must not be 0
 - Post-Condition: the return value is 10 divided by the parameter
- **Loop Invariants:**
 - “the value of i is between 0 and array length minus 1”

State Invariants with *<assert.h>*

```
1 void f() {
2     int* p = (int*)malloc(sizeof(int));
3
4     if (!p)
5         return;
6
7     assert(p); // assume p is valid from here
8     // ...
9 }
10
11 void g() {
12     Node* p = find( 'a' );
13
14     assert(p); // we inserted 'a' before
15     // ...
16 }
```

Data Invariants with `<assert.h>`

```
1  typedef struct {
2      char* s;
3      int n;
4  } str;
5
6  str* construct( char* s ) {
7      str* x = (str*)malloc( sizeof(str) );
8      // ...
9      assert( (x->s == NULL && x->n == -1)
10             || (x->n == strlen( x->s ) ) );
11 }
```

Pre/Post Conditions with `<assert.h>`

```
1  int f( int x ) {
2      assert( x != 0 ); // pre-condition
3
4      int r = 10/x;
5
6      assert( r == 10/x ); // post-condition
7
8      return r;
9  }
```

Loop Invariants with `<assert.h>`

```
1 void f( int a[], int n ) {
2     int i = 0;
3
4     // holds before the loop
5     assert( 0 <= i && i <= n );
6     assert( i < 1 || a[i-1] == 0 );
7
8     while ( i < n ) {
9         // holds before each iteration
10        assert( 0 <= i && i <= n );
11        assert( i < 1 || a[i-1] == 0 );
12
13        a[i++] = 0;
14    }
15    // holds after exiting the loop
16    assert( 0 <= i && i <= n );
17    assert( i < 1 || a[i-1] == 0 );
18
19    return;
20 }
```

- 2014-04 - assert -

98/120

Old Variables, Ghost Variables

```
1 void xorSwap( unsigned int* a, unsigned int* b ) {
2     #ifndef NDEBUG
3         unsigned int *old_a = a, *old_b = b;
4     #endif
5     assert( a && b ); assert( a != b ); // pre-condition
6
7     *a = *a + *b;
8     *b = *a - *b;
9     *a = *a - *b;
10
11    assert( *a == *old_b && *b == *old_a ); // post-con-
12    assert( a == old_a && b == old_b );    // dition
13 }
```

- 2014-04 - assert -

99/120

Outlook

- Some verification tools simply verify for each `assert` statement:
When executed, `expression` is not false.
- Some verification tools support sophisticated requirements specification languages like ACSL with explicit support for
 - pre/post conditions
 - ghost variables, old values
 - data invariants
 - loop invariants
 - ...

Dependable Verification (Jackson)

Dependability

- “The program has been verified.” tells us

Dependability

- “The program has been verified.” tells us **not very much.**

Dependability

- “**The program has been verified.**” tells us **not very much**.
- One wants to know (and should state):

Dependability

- “**The program has been verified.**” tells us **not very much**.
- One wants to know (and should state):
 - **Which specifications** have been considered?

Dependability

- “**The program has been verified.**” tells us **not very much**.
 - One wants to know (and should state):
 - **Which specifications** have been considered?
 - Under **which assumptions** was the verification conducted?
 - Platform assumptions: finite words (size?), mathematical integers, ...
 - Environment assumptions, input values, ...
- Assumptions are often implicit, “**in the tool**”!

Dependability

- “**The program has been verified.**” tells us **not very much**.
 - One wants to know (and should state):
 - **Which specifications** have been considered?
 - Under **which assumptions** was the verification conducted?
 - Platform assumptions: finite words (size?), mathematical integers, ...
 - Environment assumptions, input values, ...
- Assumptions are often implicit, “**in the tool**”!
- And **what does verification mean** after all?
 - In some contexts: **testing**.
 - In some contexts: **review**.
 - In some contexts: **model-checking** procedure.
(“We verified the program!” – “What did the tool say?” – “Verification failed.”)
 - In some contexts: **model-checking tool claims correctness**.

Common Errors

Distinguish

Most **generic errors** boil down to:

- specified but **unwanted behaviour**,
e.g. under/overflows
- **initialisation issues**
e.g. automatic block scope objects
- **unspecified behaviour** (J.1)
e.g. order of evaluation in some cases
- **undefined behaviour** (J.2)
- **implementation defined behaviour** (J.3)

Conformance (4)

- “A program that is
 - correct in all other aspects,
 - operating on correct data,
 - containing **unspecified behavior**

shall be a correct program and act in accordance with 5.1.2.3. (Program Execution)

- A conforming program is one that is acceptable to a conforming implementation.
- Strictly conforming programs are intended to be maximally portable among conforming implementations.
- An implementation [of C, a compiler] shall be accompanied by a document that defines all implementation-defined and locale-specific characteristics and all extensions.

Over- and Underflows

Over- and Underflows, Casting

- Not specific to C...

```
1 void f( short a, int b ) {
2     a = b; // typing ok, but...
3 }
4
5 short a; // provisioning, implicit cast
6 if (++a < 0) { /* no */ }
7
8 if (++i > MAX_INT) {
9     /* no */ }
10
11
12 int e = 0;
13
14 void set_error() { e++; }
15 void clear_error() { e = 0; }
16
17 void g() { if (e) { /* ... */ } }
```

- 2014-04 - pitfalls -

107/120

Initialisation (6.7.8)

- 2014-04 - pitfalls -

108/120

Initialisation (6.7.8)

- “If an object that has automatic storage duration is not initialized explicitly, its value is indeterminate.”

```
1 void f() {  
2     int a;  
3  
4     printf( "%i\n", a ); // surprise ...  
5 }
```

Unspecified Behaviour (J.1)

Unspecified Behaviour (J.1)

Each implementation (of a compiler) documents how the choice is made.

For example

- whether two string literals result in distinct arrays (6.4.5)
- the order in which the function designator, arguments, and subexpressions within the arguments are evaluated in a function call (6.5.2.2)
- the layout of storage for function parameters (6.9.1)
- the result of rounding when the value is out of range (7.12.9.5, ...)
- the order and contiguity of storage allocated by successive calls to `malloc` (7.20.3)
- etc. pp.

```
1 char a[] = "hello", b[] = "hello"; // a == b?  
2  
3 i = 0; f( ++i, ++i, ++i ); // f(1,2,3)?  
4  
5 int g() { int a, b; } // &a > &b ?  
6  
7 int* p = malloc( sizeof( int ) );  
8 int* q = malloc( sizeof( int ) ); // q > p?
```

– 2014-04 – pitfalls –

111/120

Undefined Behaviour (J.2)

– 2014-04 – pitfalls –

112/120

Undefined Behaviour (3.4.3)

“Behaviour, upon use of a non-portable or erroneous program construct or of erroneous data, for which this International Standard imposes no requirements.”

“Possible undefined behaviour ranges from

- ignoring the situation completely with **unpredictable results**,
- to behaving during **translation or program execution** in a documented manner characteristic of the environment (with or without the issuance of a diagnostic message),
- to terminating a **translation or execution** (with the issuance of a diagnostic message).”

– 2014-04 – pitfalls –

“An example of undefined behaviour is the behaviour on **integer overflow**.”

113/120

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)

– 2014-04 – pitfalls –

114/120

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)
- the value of the second operand of the / or % operator is zero (6.5.5)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)
- the value of the second operand of the / or % operator is zero (6.5.5)
- pointers that do not point into, or just beyond, the same array object are subtracted (6.5.6)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)
- the value of the second operand of the / or % operator is zero (6.5.5)
- pointers that do not point into, or just beyond, the same array object are subtracted (6.5.6)
- An array subscript is out of range [...] (6.5.6)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)
- the value of the second operand of the / or % operator is zero (6.5.5)
- pointers that do not point into, or just beyond, the same array object are subtracted (6.5.6)
- An array subscript is out of range [...] (6.5.6)
- the program removes the definition of a macro whose name begins with an underscore and either an uppercase letter or another underscore (7.1.3)

Undefined Behaviour (J.2)

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)
- the value of the second operand of the / or % operator is zero (6.5.5)
- pointers that do not point into, or just beyond, the same array object are subtracted (6.5.6)
- An array subscript is out of range [...] (6.5.6)
- the program removes the definition of a macro whose name begins with an underscore and either an uppercase letter or another underscore (7.1.3)
- etc. pp.

– 2014-04 – pitfalls –

114/120

Null-Pointer

```
1 int main() {  
2     int *p;  
3     *p = 27;  
4     return 0;  
5 }
```

– 2014-04 – pitfalls –

115/120

Null-Pointer

```
1 int main() {
2     int *p;
3     *p = 27;
4     return 0;
5 }
```

- “An integer constant expression with the value 0, or such an expression cast to type `void*`, is called a **null pointer constant**. [...]”
- “The macro **NULL** is defined in `<stddef.h>` (and other headers) as a null pointer constant; see 7.17.”
- “Among the invalid values for dereferencing a pointer by the unary `*` operator are a null pointer, [...]” (6.5.3.2)

Segmentation Violation

```
1 int main() {
2     int *p = (int*)0x12345678;
3     *p = 27;
4
5     *(int*)((void*)p) + 1 = 13;
6     return 0;
7 }
```

Segmentation Violation

```
1 int main() {
2     int *p = (int*)0x12345678;
3     *p = 27;
4
5     *(int*)((void*)p) + 1 = 13;
6     return 0;
7 }
```

- Modern operating systems provide **memory protection**.
- Accessing memory which the process is not allowed to access is observed by the operating system.
- Typically an instance of “accessing an object outside its lifetime”.
- **But:** other way round does not hold, accessing an object outside its lifetime does not imply a segmentation violation.

Segmentation Violation

```
1 int main() {
2     int *p = (int*)0x12345678;
3     *p = 27;
4
5     *(int*)((void*)p) + 1 = 13;
6     return 0;
7 }
```

- Modern operating systems provide **memory protection**.
- Accessing memory which the process is not allowed to access is observed by the operating system.
- Typically an instance of “accessing an object outside its lifetime”.
- **But:** other way round does not hold, accessing an object outside its lifetime does not imply a segmentation violation.
- Some platforms (e.g. SPARC): unaligned memory access, i.e. outside word boundaries, not supported by hardware (“bus error”).
Operating system notifies process, default handler: terminate, dump core.

Implementation-Defined Behaviour (J.3)

Implementation-Defined Behaviour (J.3)

“A conforming implementation is required to document its choice of behavior in each of the areas listed in this subclause. The following are implementation-defined:”

Implementation-Defined Behaviour (J.3)
