

2014-04 - main -

Formal Methods for C

Seminar – Summer Semester 2014

Daniel Drietsch, Sergio Fao Arenis, Marius Greitschus, Bernd Westphal

Plan

- (15 min.) Topic lottery: prepare lottery ticket with $R_{1.5}$
 - name
 - first preference topic
 - second preference topic
- Introduction to C (1)
- (15 min.) The VM (Marius)

2014-04 - plan -

2/100

2014-04 - overview -

3/100

Overview

Goals

- Educational Objectives:** Capabilities for following tasks/questions.
- Rough overview over concepts of the C programming language.
 - IOW: know, what to look for in books/manuals
 - (We try to stick with the names from of ISO/IEC 9899:1999.)
 - IOW: don't be badly surprised from the examples.
 - The concept of pointers.
 - Basic work-flow, tool-usage (headers, sources, compiler, linker).
 - Orthogonal: Rough overview over common sources of errors.
 - Formal methods and C.
 - **Not:** reference manual, each and every feature.
 - **Not:** programming course.

4/100

Everybody Say "Hello" to C

```

1 #include <stdio.h>
2
3 int g( int x ) {
4     return x/2;
5 }
6
7 int f() {
8     return g(1);
9 }
10
11 int main() {
12     printf( "Hello-World \n" );
13     return f();
14 }

```

2014-04 - overview -

5/100

42 Years of C

- 1972: Created by **Dennis Ritchie** († 2011) for Unix system programming.
- 1978: Brian W. Kernighan & Dennis Ritchie: "The C Programming Language" – "K&R C".
- 1989: ANSI X3.159-1989 – C89, C90 (still most widely used (?))
- 1999: ISO/IEC 9899:1999 – C99 (use `-std=c99` for `gcc(1)`)
- 2011: ISO/IEC 9899:2011 – C11

2014-04 - overview -

6/100

- 1972: Created by **Dennis Ritchie** (1931) for Unix system programming.
- 1978: Brian W. Kernighan & Dennis Ritchie: "The C Programming Language" - "K&R C".
- 1989: ANSI X3.159-1989 - C89, **C90** (still most widely used (?!))
- 1999: ISO/IEC 9899:1999 - C99, (use `-std=c99` for gcc1))
- 2011: ISO/IEC 9899:2011 - C11

- Compilers for virtually every platform (CPU + operating system) available. Virtually every CPU vendor offers an own C compiler. In particular in the embedded domain (MSP 430, ARM, intel...)
- Still No. 1 programming language for embedded systems software, hardware drivers, performance critical applications, ...
- Preferred by many **embedded programmers** for "lack of surprises"; (without optimisation) direct correspondence between C code and assembler.
- Resources widely controllable by programmer.
- downside: programmer needs to "know what one's doing"

6/120

- Brief history ✓
- Comments
- Declarations and Scopes
- Variables
- Expressions and Statements
- Functions
- Scopes
- Pointers
- Dynamic Storage & Storage Duration
- Storage Class Specifiers
- Strings and I/O
- Tools & Modules
- Formal Methods for C
- Common Errors

7/120

8/120

- one line comment, until end of line: `// ...`
- generic comment, no nesting: `/* ... */`
- corner cases:

```

1  "a//b"
2  #include "//e"
3  // */
4  f = g/**/h;
5  \
6  i();
7  \
8  / j();
9  #define glue(x,y) x##y
10 glue(/./) k():
11 /./s//1():
12 m = n/**+/o
13 + p;

```

// four-character string literal
// undefined behavior
// comment, not syntax error
// equivalent to f = g / h;
// part of a two-line comment
// part of a two-line comment
// syntax error, not comment
// equivalent to l():
// equivalent to m = n + p;

9/120

10/120

11/120

Basic Types (6.2.5), Constants (6.4.4)

```

1 char c = 'a', d = 93;
2
3 int x = 027; // octal/
4 long int y = 3L, z;
5 short int w = 0x8EEF;

```

[...] **char** is large enough to store any member of the basic exec. character set.
 "A plain" **int** object has the natural size suggested by the architecture of the execution environment (large enough [for values] INT_MIN to INT_MAX)."

```

1 unsigned int x = 270;

```

char, short int, int, long int, long long int also as **unsigned**!

```

1 float f = 1;
2 double g = 314159e-5;
3 long double h;

```

12:00

Bool (6.2.5)

- Only introduced in C99,
- "An object declared as type **bool** is large enough to store the values 0 and 1."
- **<stdbool.h>** (→ later) defines **bool, true, false** as macros (→ later).

- Before C99, and still very common:
- Use scalar type (including pointers)
- **0, false**
- **everything else: true**
- values of boolean expressions: **0, 1**

```

1 int y = 27;
2 int x = 13 && (y > 0); // value of x becomes 1

```

2014-04 - dep -

13:00

Derived Types (6.2.5), (6.7)

- **array types:**
- ```

1 int a[10];
2 char b[2][3];

```

- **structured types:**

```

1 typedef struct {
2 int n;
3 double d;
4 } S; // declaration of type 'S'
5 S s; // declaration of variable 's' of type 'S'
6
7 struct { int a; double b; } Y; // declaration of...?
8
9 typedef struct { S[3] S; double d; } T;

```

**Note:** *x* and *y* are of different type!

- **union types:** not here
- **function types, pointer types:** later

2014-04 - dep -

14:00

## Declaration Syntax

- ...takes a little bit getting used to:

```

1 int c, *p, a[3], *q[2], (*f)(int);

```

- is a shorthand notation for:

```

1 int c; // integer
2 int *p; // pointer to integer
3 int a[3]; // array of 3 integers
4 int *q[2]; // array of 2 pointers to integer
5 int (*f)(int); // function pointer...

```

- And what's declared here, what is its type?

```

1 int (*g)(int (*)(int*[2]))); // ...?

```

15:00

## Expressions

- "An **expression** is a sequence of operators and operands that specifies computation of a value, or that designates an object or a function, or that generates side effects, or that performs a combination thereof."
- basically like Java:
- postfix operators:
- unary operators:
- cast operators:
- multiplicative, additive
- relational, equality:
- logical operators:
- conditional operator:
- assignment operator (are expressions!):
- comma operator:

```

a++ p-- q-? y
++a sizeof(int), &a, *p
(double)a
a < b, a == b, a != b
(a < b) && (c > 0)
a < b ? a : b
a = b, a += b, a = b = 0
a = b, c = d

```

2014-04 - dep -

17:00

## Boolean Logic (6.3.2.1, 6.5.13-6.5.15)

- "When any scalar value is converted to `bool`, the result is 0 [false] if the value compares equal to 0; otherwise, the result is 1." (6.3.2.1)
- `(a <= 0)` and `!a` are equivalent (if `a` is of scalar type), so are `(a <= 0)` and `!a` *not same*
- for pointers (later): `p == NULL` and `!p` are equivalent

18/100

## Bitwise Operators (6.5.3.3, 6.5.7, 6.5.10-12)

- Often used in hardware level programming: Communicate with "the hardware" via memory-mapped registers – single bits or groups of bits have particular, platform dependent meaning.
- Bitwise And, Or, Xor (6.5.10-12):  
$$\begin{array}{r} 0101_2 \ \& \ 1100_2 = 0100_2 \\ 0101_2 \ \& \ 1100_2 = 0000_2 \end{array}$$
*align*
- Useful idioms (assuming 4-bit type):
  - Set the 3rd bit: `a |= 01002`
  - Clear the 2nd bit: `a &= 11012`
  - Test whether 2nd bit set: `a & 00102`
- Shift (6.5.7): `a << 2`, `a >> 2` (unsigned `!`) filled up with 0 at left and right)
- Bitwise complement (6.5.3.3): `~a`

Be careful with signed types (bit-operations at best on unsigned):

```
~!int(1) == 0xFFFFFFFF // == -2
```

19/100

## Lvalues (6.3.2.1)

```
1 int x, a[3], *p;
2
3 x = 27;
4 a[1] = 0;
5 p = &x;
6 *p = 13;
7
8 &x = ...; // no, only as initializer
9 a = ...; // no, only as initializer
```

- "An **lvalue** is an expression with an object type or an incomplete type other than `void`."
- "The name "value" [comes from] E1 = E2, in which the **left** operand E1 is required to be a (modifiable) lvalue. What is sometimes called "value" is in this International Standard described as the "value of an expression". An obvious example of an lvalue is an identifier of an object."

20/100

## Statements

21/100

## Statements (6.8)

- "A **statement** specifies an action to be performed. Except as indicated, statements are executed in sequence."
- also basically like Java:
  - Selection statements (6.8.4):  

```
if, else, switch
```
  - Iteration statements (6.8.5):  

```
while, do ... while, for
```
  - Jump statements (6.8.6):  

```
goto, continue, break, return
```

22/100

## Functions

23/100

## Function Definitions (6.9.1)

```

1 int max(int a, int b)
2 {
3 return a > b ? a : b;
4 }

```

*def + def*

- no nesting, no member functions
- all in file (global) scope (but: module scope possible (later))
- call-by-value semantics (call-by-reference: later)

Function declaration (vs. **definition**):

```

1 int max(int a, int b); // param. names just "decoration"
2 int max(int, int);

```

- "Zero or many declarations, exactly one **definition**."

24/100

## Scopes of Identifiers (6.2.1)

- Different entities designated by the same identifier** either have different scopes, or are in different name spaces. **There are four kinds of scopes:**

- "A label name is the only kind of identifier that has function scope."
- "Every other identifier has scope determined by the placement of its declaration (in a declarator or type specifier)."

- Declare before use:**

each identifier must be declared before (i.e. earlier in the source file) its first use in, e.g., an expression. (Unlike Java!)

*NO: f(x) { a=2; }  
 a=2;  
 }  
 Like: class CF { id f(x) { a=2; return 9; }  
 }  
 k(x);*

27/100

## Scopes

```

1 int a; // file scope (F)
2 struct { int a; } s; // name-space
3
4 int f(int a) // block scope, block (A)
5 {
6 f(a) // uses a(A)
7 a = 0; // uses a(A)
8 }
9
10 int a = 21; // block scope, block (B)
11
12 s.a = a; // uses a(A)
13 return a; // uses a(A)
14 }
15
16
17 int main() { return (0); /* uses a(F) */ }

```

25/100

## Scopes of Identifiers (6.2.1)

- Different entities designated by the same identifier** either have different scopes, or are in different name spaces. **There are four kinds of scopes:**

- "A label name is the only kind of identifier that has function scope."
- "Every other identifier has scope determined by the placement of its declaration (in a declarator or type specifier)."

- Declare before use:**

each identifier must be declared before (i.e. earlier in the source file) its first use in, e.g., an expression. (Unlike Java!)

- "Hidden" identifiers are not accessible:**

```

1 int a; /* (F) */
2 void f(int a) { /* (A) */
3 a = 0; // a(A)
4 // a(F) not accessible here. "hidden" by a(A)
5 }

```

27/100

## Scopes of Identifiers (6.2.1)

```

1 int a; // file scope (F)
2 struct { int a; } s; // name-space
3
4 int f(int a) // block scope, block (A)
5 {
6 f(a) // uses a(A)
7 a = 0; // uses a(A)
8 }
9
10 int a = 21; // block scope, block (B)
11
12 s.a = a; // uses a(A)
13 return a; // uses a(A)
14 }
15
16
17 int main() { return (0); /* uses a(F) */ }

```

*"id f(a) not accessible here" with arrows pointing to lines 7 and 8 of the code block above.*

- "The same identifier can denote different entities at diff. points in the program."
- "For each different entity that an identifier designates, the identifier is visible (i.e., can be used) only within a region of program text called its **scope**."

26/100

## Pointers

28/100

```
1 char c = 127;
```

the compiler chose to store values of 'c' at memory cell with address 0x1001

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x1000 | 0x1001 | ...    | 0x1002 | 0x1003 | 0x1004 | 0x1005 | 0x1006 | 0x1007 |
| 0x1008 | 0x7F   | 0x100A | 0x100B | 0x100C | 0x100D | 0x100E | 0x100F | 0x1010 |
| 0x1012 | 0x1013 | 0x1014 | 0x1015 | 0x1016 | 0x1017 | 0x1018 | 0x1019 | 0x101A |
| ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    |

```
1 char c = 127;
2 c = c + 1;
```

"c = c + 1" means: the new value of c is the old value plus 1. In assembler: read 0x1001, R; inc R; write R, 0x1001

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x1000 | 0x1001 | 0x1002 | 0x1003 | 0x1004 | 0x1005 | 0x1006 | 0x1007 | 0x1008 |
| 0x1008 | 0x7F   | 0x100A | 0x100B | 0x100C | 0x100D | 0x100E | 0x100F | 0x1010 |
| 0x1012 | 0x1013 | 0x1014 | 0x1015 | 0x1016 | 0x1017 | 0x1018 | 0x1019 | 0x101A |
| ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    |

```
1 char c = 127;
2 c = c + 1;
```

"c = c + 1" means: the new value of c is the old value plus 1. In assembler: read 0x1001, R; inc R; write R, 0x1001

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x1000 | 0x1001 | 0x1002 | 0x1003 | 0x1004 | 0x1005 | 0x1006 | 0x1007 | 0x1008 |
| 0x1008 | 0x80   | 0x100A | 0x100B | 0x100C | 0x100D | 0x100E | 0x100F | 0x1010 |
| 0x1012 | 0x1013 | 0x1014 | 0x1015 | 0x1016 | 0x1017 | 0x1018 | 0x1019 | 0x101A |
| ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    |

```
1 char c = 127;
2 c = c + 1;
3 char* p = &c;
```

the compiler chose to store values of variable 'p' at memory cells (i) with address 0x1002 and 0x1003

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x1000 | 0x1001 | 0x1002 | 0x1003 | 0x1004 | 0x1005 | 0x1006 | 0x1007 | 0x1008 |
| 0x1008 | 0x80   | 0x10   | 0x01   | 0x100C | 0x100D | 0x100E | 0x100F | 0x1010 |
| 0x1012 | 0x1013 | 0x1014 | 0x1015 | 0x1016 | 0x1017 | 0x1018 | 0x1019 | 0x101A |
| 0x101C | 0x101D | 0x101E | 0x101F | 0x1020 | 0x1021 | 0x1022 | 0x1023 | 0x1024 |
| ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    |

```
1 char c = 127;
2 c = c + 1;
3 char* p = &c;
4 *p = *p + 3;
```

dereference

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x1000 | 0x1001 | 0x1002 | 0x1003 | 0x1004 | 0x1005 | 0x1006 | 0x1007 | 0x1008 |
| 0x1008 | 0x80   | 0x10   | 0x01   | 0x100C | 0x100D | 0x100E | 0x100F | 0x1010 |
| 0x1012 | 0x1013 | 0x1014 | 0x1015 | 0x1016 | 0x1017 | 0x1018 | 0x1019 | 0x101A |
| ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    |

```
1 char c = 127;
2 c = c + 1;
3 char* p = &c;
4 *p = *p + 3;
```

\*p: get the value of p again (0x1001), write the addition result (0x85) to that address (to 0x1001)

\*p: get the value of p (0x1001) and read the value at that address (at 0x1001, yields 0x80) add 3 to the value just obtained (yields 0x85)

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x1000 | 0x1001 | 0x1002 | 0x1003 | 0x1004 | 0x1005 | 0x1006 | 0x1007 | 0x1008 |
| 0x1008 | 0x85   | 0x10   | 0x01   | 0x100C | 0x100D | 0x100E | 0x100F | 0x1010 |
| 0x1012 | 0x1013 | 0x1014 | 0x1015 | 0x1016 | 0x1017 | 0x1018 | 0x1019 | 0x101A |
| ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    | ...    |

```

1 char c = 127;
2 c = c + 1;
3 char* p = &c;
4 *p = *p + 3;
5 char* q = p;

```

\*p, rhs: get the value of p (0x1001) and read the value at that address (at 0x1001, yields 0x83)

\*p, lhs: get the value of p again (0x1001), write the addition result (0x83) to that address (to 0x1001)

|        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x1000 | 0x1001 | 0x1002 | 0x1003 | 0x1004 | 0x1005 | 0x1006 | 0x1007 |
|        | 0x83   | 0x10   | 0x01   | ...    | ...    | ...    | ...    |
| 0x1008 | 0x1009 | 0x100A | 0x100B | 0x100C | 0x100D | 0x100E | 0x100F |
| 0x1010 | 0x1011 | 0x1012 | 0x1013 | 0x1014 | 0x1015 | 0x1016 | 0x1017 |

```

1 char c = 127;
2 c = c + 1;
3 char* p = &c;
4 *p = *p + 3;
5 char* q = p;

```

assume the compiler chooses to store values of variable 'q' at memory cells (!) with addresses 0x1004 and 0x1005

|        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x1000 | 0x1001 | 0x1002 | 0x1003 | 0x1004 | 0x1005 | 0x1006 | 0x1007 |
|        | 0x80   | 0x10   | 0x01   | 77     | 77     | ...    | ...    |
| 0x1008 | 0x1009 | 0x100A | 0x100B | 0x100C | 0x100D | 0x100E | 0x100F |
| 0x1010 | 0x1011 | 0x1012 | 0x1013 | 0x1014 | 0x1015 | 0x1016 | 0x1017 |

```

1 char c = 127;
2 c = c + 1;
3 char* p = &c;
4 *p = *p + 3;

Pointers vs. Arrays

ARRAYS

```

1 char a[5] = { 'H', 'e', 'l', 'l', 'o' };

```

ARRAYS

reserve some space for 5 chars...

```

1 char a[5] = { 'H', 'e', 'l', 'l', 'o' };

```

...and let a point to that space

ARRAYS

reserve some space for 5 chars...

```

1 char a[5] = { 'H', 'e', 'l', 'l', 'o' };

```

...and let a point to that space

2 int* p = a;
3 for (int i = 0; i < 3; ++i)
4 *p = 0x3421;

```

Pointers to Void, Pointer Arithmetic

```

1 int f[3] a = { 10, 010, 0x1234 };
2 int* p = a;
3 void* q = a;
4 for (int i = 0; i < 3; ++i) {
5 p++;
6 q++;
7 }

```

```

1 int f[3] a = { 10, 010, 0x1234 };
2 int* p = a;
3 void* q = a;
4 for (int i = 0; i < 3; ++i) {
5 p++;
6 q++;
7 }

```

```

1 int f[3] a = { 10, 010, 0x1234 };
2 int* p = a;
3 void* q = a;
4 for (int i = 0; i < 3; ++i) {
5 p++;
6 q++;
7 }

```

```

1 int f[3] a = { 10, 010, 0x1234 };
2 int* p = a;
3 void* q = a;
4 for (int i = 0; i < 3; ++i) {
5 p++;
6 q++;
7 }

```

```

1 int f[3] a = { 10, 010, 0x1234 };
2 int* p = a;
3 void* q = a;
4 for (int i = 0; i < 3; ++i) {
5 p++;
6 q++;
7 }

```

```

1 int f[3] a = { 10, 010, 0x1234 };
2 int* p = a;
3 void* q = a;
4 for (int i = 0; i < 3; ++i) {
5 p++;
6 q++;
7 }

```

```

1 int [3] a = { 10, 010, 0x1234 };
2 int* p = a;
3 void* q = a;
4 for (int i = 0; i < 3; ++i) {
5 p++;
6 q++;
7 }

```

Pointers: Observation

- A variable of pointer type just stores an address.
- So do variables of array type.
- Pointers can point to a certain type, or to void
- A pointer to void shall have the same representation and alignment requirements as a pointer to a character type." (6.2.5.2b)
- The effect of "incrementing" a pointer depends on the type pointed to.

```

1 int a[2];
2 int* p = a;
3 ++p; // points to a[1]
4 void* q = a;
5 q = sizeof(int); // points to a[1]
6 ++q; // may point into the middle

```

Pointer Arithmetic

```

1 int [3] a = { 10, 010, 0x1234 }, i = 0;
2
3 int* p = a; // not &a i
4
5 if (a[0] == *p) i++;
6 if (a[1] == *(p+1)) i++;
7 if (a[2] == *(p+2)) i++;
8
9 if (&(a[2]) - p == 2) i++;
10
11 void* q = a;
12
13 if (a[2] == *((int*)(q + (2 * sizeof(int)))))) i++;
14
15 // i == 5

```

void as such does not have values, we need to cast 'q' here... note void\* can be cast to everything

Pointers for Call By Reference

```

1 void f(int x, int y) {
2 x++; y++;
3 }
4 void g(int* p, int* q) {
5 (*p)++; (*q)++;
6 }
7 int a = 2, b = 5;
8 f(a, b);
9 g(&a, &b);

```

Call By Reference with Pointers

```

1 void f(int x, int y) {
2 x++; y++;
3 }
4 void g(int* p, int* q) {
5 (*p)++; (*q)++;
6 }
7 int a = 2, b = 5;
8 f(a, b);
9 g(&a, &b);

```

### Dynamic Storage & Storage Duration

49/130

### A Linked List

```

1 typedef struct Node {
2 char data;
3 struct Node* next;
4 } Node;
5
6 Node c = { 'C', 0 };
7 Node b = { 'B', &c };
8 Node a = { 'A', &b };

```

51/130

### Dynamic Storage Allocation

50/130

### Dynamic Storage Allocation

```

1 typedef struct Node {
2 char data; struct Node* next; } Node;
3
4 Node head = 0, *hip;
5
6 void insert(char d) {
7 hip = (Node*)malloc(sizeof(Node));
8 hip->data = d;
9 hip->next = head;
10 head = hip;
11 }
12
13 insert('C');
14 insert('B');
15 insert('A');

```

52/130

### A Linked List

```

1 typedef struct Node {
2 char data;
3 struct Node* next;
4 } Node;
5
6 Node c = { 'C', 0 };
7 Node b = { 'B', &c };
8 Node a = { 'A', &b };

```

51/130

### Dynamic Storage Allocation

```

1 typedef struct Node {
2 char data; struct Node* next; } Node;
3
4 Node head = 0, *hip;
5
6 void insert(char d) {
7 hip = (Node*)malloc(sizeof(Node));

## Dynamic Storage Management

Dynamic Storage Allocation:

- `void* malloc( size_t size );`
- "[...] allocates **size** bytes and returns a pointer to the allocated memory. **The memory is not initialized.** [...]"
- "On error, [this function] returns NULL."

53/120

## Dynamic Storage Management

Dynamic Storage Allocation:

- `void* malloc( size_t size );`
- "[...] allocates **size** bytes and returns a pointer to the allocated memory. **The memory is not initialized.** [...]"
- "On error, [this function] returns NULL."
- `void free( void* ptr )`
- "[...] frees the memory space pointed to by **ptr**, which **must** have been returned by a previous call to `malloc()`. [...]"
- "Otherwise, or if `free(ptr)` has already been called before, **undefined behavior** occurs."
- "If **ptr** is NULL, no operation is performed."

## Dynamic Storage Management

Dynamic Storage Allocation:

- `void* malloc( size_t size );`
- "[...] allocates **size** bytes and returns a pointer to the allocated memory. **The memory is not initialized.** [...]"
- "On error, [this function] returns NULL."
- `void free( void* ptr )`
- "[...] frees the memory space pointed to by **ptr**, which **must** have been returned by a previous call to `malloc()`. [...]"
- "Otherwise, or if `free(ptr)` has already been called before, **undefined behavior** occurs."
- "If **ptr** is NULL, no operation is performed."
- **No garbage collection!**
- Management of dynamic storage is **responsibility of the programmer**. Unaccessible, not free'd memory is called **memory leak**.

2014-04 - storage -

54/120

### Dynamic Storage Management Example

```

1 void remove() {
2 if (hip == head) {
3 head = hip->next;
4 free(hip);
5 }
6 }
7 insert('C'); insert('B'); insert('A');
8 remove();
9 insert('X');

```

|        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x0000 | 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 |
| 0x0008 | 0x0009 | 0x000A | 0x000B | 0x000C | 0x000D | 0x000E | 0x000F |

### Dynamic Storage Management Example

```

1 void remove() {
2 if (hip == head) {
3 head = hip->next;
4 free(hip);
5 }
6 }
7 insert('C'); insert('B'); insert('A');
8 remove();
9 insert('X');

```

|        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x0000 | 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 |
| 0x0008 | 0x0009 | 0x000A | 0x000B | 0x000C | 0x000D | 0x000E | 0x000F |
| 0x0010 | 0x0011 | 0x0012 | 0x0013 | 0x0014 | 0x0015 | 0x0016 | 0x0017 |
| 0x0018 | 0x0019 | 0x001A | 0x001B | 0x001C | 0x001D | 0x001E | 0x001F |
| 0x0020 | 0x0021 | 0x0022 | 0x0023 | 0x0024 | 0x0025 | 0x0026 | 0x0027 |
| 0x0028 | 0x0029 | 0x002A | 0x002B | 0x002C | 0x002D | 0x002E | 0x002F |

### Dynamic Linked List Iteration

```

1 Node* find(char d) {
2 hip = head;
3 while (hip) {
4 if (hip->data == d)
5 break;
6 hip = hip->next;
7 }
8 return hip;
9 }
10 insert('C'); insert('B'); insert('A');
11 find('B'); // yields 0x1008
12 find('O'); // yields 0x0000, aka. NULL

```

|        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x0000 | 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 |
| 0x0008 | 0x0009 | 0x000A | 0x000B | 0x000C | 0x000D | 0x000E | 0x000F |
| 0x0010 | 0x0011 | 0x0012 | 0x0013 | 0x0014 | 0x0015 | 0x0016 | 0x0017 |
| 0x0018 | 0x0019 | 0x001A | 0x001B | 0x001C | 0x001D | 0x001E | 0x001F |
| 0x0020 | 0x0021 | 0x0022 | 0x0023 | 0x0024 | 0x0025 | 0x0026 | 0x0027 |
| 0x0028 | 0x0029 | 0x002A | 0x002B | 0x002C | 0x002D | 0x002E | 0x002F |

### Dynamic Storage Management Example

```

1 void remove() {
2 if (hip == head) {
3 head = hip->next;
4 free(hip);
5 }
6 }
7 insert('C'); insert('B'); insert('A');
8 remove();
9 insert('X');

```

|        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x0000 | 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 |
| 0x0008 | 0x0009 | 0x000A | 0x000B | 0x000C | 0x000D | 0x000E | 0x000F |
| 0x0010 | 0x0011 | 0x0012 | 0x0013 | 0x0014 | 0x0015 | 0x0016 | 0x0017 |
| 0x0018 | 0x0019 | 0x001A | 0x001B | 0x001C | 0x001D | 0x001E | 0x001F |
| 0x0020 | 0x0021 | 0x0022 | 0x0023 | 0x0024 | 0x0025 | 0x0026 | 0x0027 |
| 0x0028 | 0x0029 | 0x002A | 0x002B | 0x002C | 0x002D | 0x002E | 0x002F |

### Pointers to Struct/Union — '! vs. '>'

```

1 typedef struct {
2 int x;
3 int y;
4 } coordinate;
5
6 coordinate pos = { 13, 27 };
7
8 coordinate* p = &pos;
9
10 int tmp;
11
12 tmp = (*p).x;
13 (*p).x = (*p).y;
14 (*p).y = tmp;
15
16 tmp = p->x;
17 p->x = p->y;
18 p->y = tmp;

```

Storage Duration of Objects

- "static" – e.g. variables in program scope:
  - live from program start to end
  - if not explicitly initialized, set to 0 (6.7.8)
- "automatic" – non-static variables in local scope:
  - live from block entry to exit
  - not automatically initialised: "initial value [...] is indeterminate"
- "allocated" – dynamic objects:
  - live from malloc to free
  - not automatically initialised

"If an object is referred to outside of its lifetime, the behavior is undefined."  
 The value of a pointer becomes indeterminate when the object it points to reaches the end of its lifetime."

Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

Storage Duration of Objects (6.2.4)

- "static" – e.g. variables in program scope:
  - live from program start to end
  - if not explicitly initialized, set to 0 (6.7.8)
- "automatic" – non-static variables in local scope:
  - live from block entry to exit
  - not automatically initialised: "initial value [...] is indeterminate"
- "allocated" – dynamic objects:
  - live from malloc to free
  - not automatically initialised

"If an object is referred to outside of its lifetime, the behavior is undefined."  
 The value of a pointer becomes indeterminate when the object it points to reaches the end of its lifetime."

Storage Duration "Automatic" (Simplified)

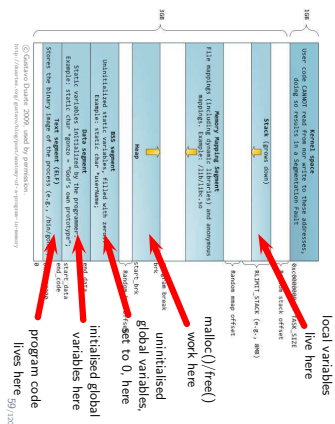

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

Example: Anatomy of a Linux Program in Memory

Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

60/120

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

60/120

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

60/120

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

60/120

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

(now) y - not explicitly initialised, thus initial value is indeterminate

60/120

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

60/120

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

y no longer alive!

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

### Storage Duration "Automatic" (Simplified)

```

1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int* f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;

```

## Storage Duration "Automatic" (Simplified)

```
1 void h() { int y; y++; }
2 void g() { int x = 5; x++; }
3 int f() { int c = 3; g(); h(); return &c; }
4
5 int a = 27, b, *p;
6 p = f();
7 b = *p;
```

**p** refers to a non-alive object, the behavior is undefined (everything **may** happen from "crash" to "ignore").

60:130

## Storage Classes and Qualifiers

2014-04 - modifiers -

61:130

## Storage Class Specifiers (6.7.1)

```
1 typedef char letter;
2
3 extern int x;
4 extern int f();
5
6 static int x; // two uses! (-> later)
7 static int f();
8
9 auto x; // "historic"
10
11 register y; // "historic"
12
```

63:130

## Storage Class Specifiers: extern (6.7.1)

```
1 // not -defined- here, "imported" ...
2 //
3 extern int x;
4 extern void f();
5
6 // declared -and- defined here, "exported" ...
7 //
8 int y;
9
10 int g() {
11 x = y = 27;
12 f();
13 }
```

- modules linking (later)
- usually only extern in headers (later)

64:130

## Storage Class Specifiers (6.7.1)

2014-04 - modifiers -

62:130

## Storage Class Specifiers: static (6.7.1)

```
1 // declared -and- defined here.
2 //
3 // -not- "exported" ...
4 static int x;
5 static void g();
6
7
8 int f() {
9 static int a = 0;
10 a++;
11 printf("%i\n", a);
12 }
13
14 f(); f(); f(); // yields 1, 2, 3
```

65:130

### Qualifiers (6.7.3)

```

1 int x;
2
3 const int y;
4
5 volatile int z;
6
7 int* restrict p; // aliasing
8
9
10 const volatile int a;

```

### Qualifiers (6.7.3)

```

1 int x;
2
3 const int y;
4
5 volatile int z;
6
7 int* restrict p; // aliasing
8
9
10 const volatile int a;

```

**restrict:**

- "...: lengthy formal definition ...!"
- "[...:] If these requirements are not met, then the behavior is **undefined**."
- → use **extremely carefully** (i.e. if in doubt, not at all)

### Excursion: Memory Mapped I/O

- **Intuition:** some memory addresses are wired to hardware
- **writing** to the address causes a pin to change logical value
- **reading** the address gives logical value of a pin

### Excursion: Memory Mapped I/O

- **Intuition:** some memory addresses are wired to hardware
- **writing** to the address causes a pin to change logical value
- **reading** the address gives logical value of a pin

### Excursion: Memory Mapped I/O

- **Intuition:** some memory addresses are wired to hardware
- **writing** to the address causes a pin to change logical value
- **reading** the address gives logical value of a pin

Excursion: Memory Mapped IO

- **Intuition:** some memory addresses are wired to hardware
- **writing** to the address causes a pin to change logical value
- **reading** the address gives logical value of a pin

68/120

Excursion: Memory Mapped IO

- **Intuition:** some memory addresses are wired to hardware
- **writing** to the address causes a pin to change logical value
- **reading** the address gives logical value of a pin

68/120

- The compiler does not know, "memory is memory".

Qualifiers: volatile (6.7.3)

```

1 volatile char* out = 0x1006;
2 volatile char* in = 0x1007;
3
4 out = 0x01; // switch lamp on
5
6 if (in & 0x01) { /* ... */ }
7
8 if ((in & 0x01) && (in & 0x01)) { /* ... */ }

```

69/120

Strings & Input/Output

70/120

Strings

71/120

Strings are 0-Terminated char Arrays

```

1 char* msg = "Hello";
2 char* str = msg;

```

72/120

```
1 char* msg = "Hello";
2 char* str = msg;
```

```
#include <string.h>
provides among others:
```

- `#include <string.h>` provides among others:
- `size_t strlen( const char* s )` `[...]` calculates length of string `s`, excluding the terminating null byte `( '\0' )`.

- `#include <string.h>` provides among others:
- `size_t strlen( const char* s )` `[...]` calculates length of string `s`, excluding the terminating null byte `( '\0' )`.
- `int strcmp( const char* s1, const char* s2 )` `[...]` compares the two strings `s1` and `s2`. It returns an integer less than, equal to, or greater than zero if `s1` is found, respectively, to be less than, to match, or be greater than `s2`.

- `#include <string.h>` provides among others:
- `size_t strlen( const char* s )` `[...]` calculates length of string `s`, excluding the terminating null byte `( '\0' )`.
- `int strcmp( const char* s1, const char* s2 )` `[...]` compares the two strings `s1` and `s2`. It returns an integer less than, equal to, or greater than zero if `s1` is found, respectively, to be less than, to match, or be greater than `s2`.
- `char* strcpy( char* s1, const char* s2 )` `[...]` The `strcpy()` function copies the string pointed to by `s2`, including the terminating null byte `( '\0' )`, to the buffer pointed to by `s1`.

- `#include <string.h>` provides among others:
  - `size_t strlen( const char* s )` `[...]` calculates length of string `s`, excluding the terminating null byte `( '\0' )`.
  - `int strcmp( const char* s1, const char* s2 )` `[...]` compares the two strings `s1` and `s2`. It returns an integer less than, equal to, or greater than zero if `s1` is found, respectively, to be less than, to match, or be greater than `s2`.
  - `char* strcpy( char* s1, const char* s2 )` `[...]` The `strcpy()` function copies the string pointed to by `s2`, including the terminating null byte `( '\0' )`, to the buffer pointed to by `s1`.
  - `char* strncpy( char* s1, const char* s2, size_t n )` including the terminating null byte `( '\0' )`, to the buffer pointed to by `s1`.
- None of these functions allocates memory!

## String Manipulation (Annex B)

# include<string.h>

provides among others:

- `strlen(const char* s)`

[...] calculates length of string `s`, excluding the terminating null byte `(\0)`:"

- `int strcmp(const char* s1, const char* s2)`

[...] compares the two strings `s1` and `s2`.

It returns an integer less than, equal to, or greater than zero, if `s1` is found, respectively, to be less than, to match, or be greater than `s2`."

- `char* strcpy(char* s1, const char* s2)`

"The `strcpy()` function copies the string pointed to by `s2`,

including the terminating null byte `(\0)`, to the buffer pointed to by `s1`."

- `char* strncpy(char* s1, const char* s2, size_t n)`

None of these functions allocates memory!

Allocate and copy: (not C99, but POSIX)

- `char* strdup(const char* s)`

73/100

## Input/Output

2014-04 - stringando -

74/100

## Printing

```
1 #include <stdio.h>
2
3 printf("%s\n", "Hello", 27, 314);
```

2014-04 - stringando -

75/100

## Tools & Modules

```
1 #include <stdio.h>
2
3 int g(int x) { return x/2; }
4
5 int f() { return g(1); }
6
7 int main() {
8 printf("Hello-World\n");
9 return f();
10 }
```

76/100

## Hello, Again

```
• % gcc helloworld.c
• % ls
• a.out helloworld.c
• % ./a.out
• Hello World.
• %
```

77/100

```
1 #include <stdio.h>
2
3 int g(int x) { return x/2; }
4
5 int f() { return g(1); }
6

2014-04 - tools - look -

83/120

### Compiler

- gcc [OPTION]... infile...**
- E – preprocess only
- c – compile only, don't link  
Example: gcc -c main.c — produces main.o
- o outfile – write output to outfile  
Example: gcc -o x.o main.c — produces x.o
- g – add debug information
- W, -Wall, ... – enable warnings
- I dir – add dir to include path for searching headers
- L dir – add dir to library path for searching libraries
- D macro[=defn] – define macro (to defn)  
Example: gcc -DDEBUG -DNUMBER=27
- l library link against liblibrary [-as.o], order matters  
Example: gcc a.o b.o main.o -lxy
- f, man gcc

84/120

### gdb(1), ddd(1), mml(1), make(1)

- **Command Line Debugger:**  
gdb a.out [core]
- **GUI Debugger:**  
ddd a.out [core]
- (works best with debugging information compiled in (gcc -g))
- **Inspect Object Files:**  
nm a.o
- **Build Utility:**  
make
- See battery controller exercise for an example.

85/120

### Core Dumps

- **Recall: Anatomy of a Linux Program in Memory**
- **Core dump:** (basically) this memory written to a file.

86/120

### Core Dumps

- **Recall: Anatomy of a Linux Program in Memory**
- **Core dump:** (basically) this memory written to a file.

```
1 int main() {
2 int *p;
3 *p = 27;
4 return 0;
5 }
```

### Formal Methods for C

### Correctness and Requirements

- Correctness is defined **with respect to a specification**.
- A program (function ...) is **correct** (wrt. specification  $\varphi$ ) **if and only if it satisfies  $\varphi$** .
- Definition of "satisfies": **in a minute**.

#### Examples:

- $\varphi_1$ : the return value is 10 divided by parameter (if parameter not 0)
- $\varphi_2$ : the value of variable  $x$  is "always" strictly greater than 3
- $\varphi_3$ : the value of  $i$  increases in each loop iteration
- ...

88/120

### Common Patterns

- **State Invariants:**  
"at this program point, the value of  $r$  must not be NULL"  
"at all program points, the value of  $r$  must not be NULL"  
(cf. **sequence points** (Annex C))
- **Data Invariants:**  
"the value of  $n$  must be the length of  $s$ "
- **(Function) Pre/Post Conditions:**  
Pre-Condition: the parameter must not be 0  
Post-Condition: the return value is 10 divided by the parameter
- **Loop Invariants:**  
"the value of  $i$  is between 0 and array length minus 1"

89/120

90/120

### Diagnostics (7.2)

```
1 #include <assert.h>
2 void assert(/* scalar */ expression);
```

### Poor Man's Requirements Specification aka. How to Formalize Requirements in C?

- "The assert macro puts diagnostic tests into programs: [...]  
When it is executed, if **expression** (which shall have a scalar type) is false (that is, compares equal to 0), the assert macro
- writes information about the particular call that failed [...] on the standard error stream in an implementation-defined format.
- It then calls the **abort** function."

91/120

92/120

92/120

### Diagnostics (7.2)

```
1 #include <assert.h>
2 void assert(/* scalar */ expression);
```

## Diagnostics (7.2)

```
1 #include <assert.h>
2 void assert(/* scalar */ expression);
3
```

- “The assert macro puts diagnostic tests into programs: [...]”

When it is executed, if expression (which shall have a scalar type) is false (that is, compares equal to 0), the assert macro

- writes information about the particular call that failed [...] on the standard error stream in an implementation-defined format.
- It then calls the **abort** function.”

Pitfall:

- If macro NDEBUG is defined when including <assert.h>, expression is not evaluated (thus should be side-effect free)

92.120

## abort (7.20.4.1)

```
1 #include <stdlib.h>
2 void abort();
3
```

- “The abort function causes abnormal program termination to occur, unless [...]”
- [...] An implementation-defined form of the status unsuccessful termination is returned to the host environment by means of the function call raisee(STABERT)”.  
(→ Core Dumps)

2014-04 - assert -

93.120

## Common Patterns with assert

- **State Invariants:**  
“at this program point, the value of *r* must not be NULL.”  
“at all program points, the value of *p* must not be NULL”  
(cf: **sequence points** (Annex C))
- **Data Invariants:**  
“the value of *n* must be the length of *s*”
- **(Function) Pre/Post Conditions:**  
Pre-Condition: the parameter must not be 0  
Post-Condition: the return value is 10 divided by the parameter
- **Loop Invariants:**  
“the value of *i* is between 0 and array length minus 1”

2014-04 - assert -

94.120

## State Invariants with <assert.h>

```
1 void f() {
2 int* p = (int*)malloc(sizeof(int));
3 if (!p)
4 return;
5 assert(p); // assume p is valid from here
6 // ...
7 }
8
9 void g() {
10 Node* p = find('a');
11 assert(p); // we inserted 'a' before
12 // ...
13 }
14
15
16
```

95.120

## Data Invariants with <assert.h>

```
1 typedef struct {
2 char* s;
3 int n;
4 } str_t;
5
6 str_t construct(char* s) {
7 str_t x = (str_t){ malloc(sizeof(str));
8 // ...
9 assert((x->s == NULL && x->n == -1)
10 || (x->n == strlen(x->s)));
11 }
```

2014-04 - assert -

96.120

## Pre/Post Conditions with <assert.h>

```
1 int f(int x) {
2 assert(x != 0); // pre-condition
3
4 int r = 10/x;
5
6 assert(r == 10/x); // post-condition
7
8 return r;
9 }
```

2014-04 - assert -

97.120

## Loop Invariants with `<assert>`

```
1 void f(int a[] , int n) {
2 int i = 0;
3
4 // holds before the loop
5 assert(0 <= i && i <= n);
6 assert(i < 1 || a[i-1] == 0);
7
8 while(i < n) {
9 // holds before each iteration
10 assert(0 <= i && i <= n);
11 assert(i < 1 || a[i-1] == 0);
12 a[i++] = 0;
13 }
14 // holds after exiting the loop
15 assert(0 <= i && i <= n);
16 assert(i < 1 || a[i-1] == 0);
17 return;
18 }
19
20 }
```

98:330

## Old Variables, Ghost Variables

```
1 void xorSwap(unsigned int* a , unsigned int* b) {
2 #ifndef NDEBUG
3 unsigned int *old_a = a , *old_b = b;
4 #endif
5 assert(a && b); // pre-condition
6
7 *a = *a + *b;
8 *b = *a - *b;
9 *a = *a - *b;
10
11 assert(*a == old_b && *b == *old_a); // post-con-
12 assert(a == old_a && b == old_b); // dition
13 }
```

- 2014-04 - assert -

99:330

## Outlook

- Some verification tools simply verify for each `assert` statement: When executed, expression is not false.
- Some verification tools support sophisticated requirements specification languages like ACSL with explicit support for
  - pre/post conditions
  - ghost variables, old values
  - data invariants
  - loop invariants
  - ...

- 2014-04 - assert -

100:330

## Dependable Verification (Jackson)

### Dependability

- "The program has been verified" tells us

101:330

- 2014-04 - assert -

102:330

### Dependability

- "The program has been verified" tells us **not very much**.

- 2014-04 - assert -

102:330

## Dependability

- "The program has been verified." tells us **not very much**.
- One wants to know (and should state):

102/130

## Dependability

- "The program has been verified." tells us **not very much**.
- One wants to know (and should state):
- **Which specifications** have been considered?

– 2014-04 – assert –

102/130

## Dependability

- "The program has been verified." tells us **not very much**.
  - One wants to know (and should state):
  - **Which specifications** have been considered?
  - Under **which assumptions** was the verification conducted?
  - Platform assumptions: finite words (size?), mathematical integers, ...
  - Environment assumptions: input values, ...
- Assumptions are often implicit: "in the tool!"

– 2014-04 – assert –

102/130

## Dependability

- "The program has been verified." tells us **not very much**.
  - One wants to know (and should state):
  - **Which specifications** have been considered?
  - Under **which assumptions** was the verification conducted?
  - Platform assumptions: finite words (size?), mathematical integers, ...
  - Environment assumptions: input values, ...
- Assumptions are often implicit: "in the tool!"
- And **what does verification mean** after all?
  - In some contexts: **testing**.
  - In some contexts: **review**.
  - In some contexts: **model-checking procedure**.  
(We verified the program" – "What did the tool say?" – "Verification failed!")
  - In some contexts: **model-checking tool claims correctness**.

102/130

## Common Errors

– 2014-04 – pitfalls –

103/130

## Distinguish

- Most **generic errors** boil down to:
- specified but **unwanted behaviour**,  
e.g. under/overflows
  - **initialisation issues**  
e.g. automatic block scope objects
  - **unspecified behaviour (J1)**  
e.g. order of evaluation in some cases
  - **undefined behaviour (J2)**
  - **implementation defined behaviour (J3)**

– 2014-04 – pitfalls –

104/130

## Conformance (4)

- "A program that is
  - correct in all other aspects;
  - operating on correct data;
  - containing **unspecified behavior**shall be a correct program and act in accordance with 5.1.2.3. (Program Execution)
- A conforming program is one that is acceptable to a conforming implementation.
- Strictly conforming programs are intended to be maximally portable among conforming implementations.
- An implementation [of C, a compiler] shall be accompanied by a document that defines all implementation-defined and locale-specific characteristics and all extensions.

105:iso

– 2014-04 – pitfalls –

## Over- and Underflows

106:iso

## Over- and Underflows, Casting

- Not specific to C...

```
1 void f(short a, int b) {
2 a = b; // typing ok, but...
3 }
4
5 short a; // provisioning, implicit cast
6 f(++a < 0) { /* no */ }
7
8 f(+++ > MAXINT) {
9 /* no */ }
10
11 int e = 0;
12
13 void set-error() { ++e; }
14 void clear-error() { e = 0; }
15
16 word g() { f(e) { /* ... */ } }
17
```

107:iso

– 2014-04 – pitfalls –

## Initialisation (6.7.8)

- "If an object that has automatic storage duration is not initialized explicitly, its value is indeterminate."

## Initialisation (6.7.8)

```
1 void f() {
2 int a;
3
4 printf("%i\n", a); // surprise...
5 }
```

108:iso

– 2014-04 – pitfalls –

109:iso

– 2014-04 – pitfalls –

## Unspecified Behaviour (1.1)

110:iso

## Undefined Behaviour (1.1)

Each implementation (of a compiler) documents how the choice is made.

### For example

- whether two string literals result in distinct arrays (6.4.5)
- the order in which the function designator, arguments, and subexpressions within the arguments are evaluated in a function call (6.5.2.2)
- the layout of storage for function parameters (6.9.1)
- the result of rounding when the value is out of range (7.12.9.5, ...)
- the order and contiguity of storage allocated by successive calls to `malloc` (7.20.3)
- etc. pp.

```
1 char a[] = "hello", b[] = "hello"; // a == b?
2
3 f = 0; f(++i, ++i, ++i); // f(1,2,3)?
4
5 int g() { int a, b; } // &a > &b ?
6
7 int* p = malloc(sizeof(int));
8 int* q = malloc(sizeof(int)); // q > p?
9
```

111.000

## Undefined Behaviour (1.2)

### More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)

114.000

## Undefined Behaviour (1.2)

"Behaviour, upon use of a non-portable or erroneous program construct or of erroneous data, for which this International Standard imposes no requirements."

### Undefined Behaviour (1.2)

- **Possible undefined behaviour ranges from**
- ignoring the situation completely with **unpredictable results**,
- to behaving during **translation or program execution** in a documented manner characteristic of the environment (with or without the issuance of a diagnostic message),
- to terminating a **translation or execution** (with the issuance of a diagnostic message)."

"An example of undefined behaviour is the behaviour on **integer overflow**."

112.000

## Undefined Behaviour (1.2)

### More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)

114.000

## Undefined Behaviour (3.4.3)

"Behaviour, upon use of a non-portable or erroneous program construct or of erroneous data, for which this International Standard imposes no requirements."

### Possible undefined behaviour ranges from

- ignoring the situation completely with **unpredictable results**,
- to behaving during **translation or program execution** in a documented manner characteristic of the environment (with or without the issuance of a diagnostic message),
- to terminating a **translation or execution** (with the issuance of a diagnostic message)."

"An example of undefined behaviour is the behaviour on **integer overflow**."

113.000

## Undefined Behaviour (1.2)

### More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)

114.000

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)

114/120

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)

114/120

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)

114/120

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)

114/120

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)
- the value of the second operand of the / or % operator is zero (6.5.5)

114/120

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)
- the value of the second operand of the / or % operator is zero (6.5.5)
- pointers that do not point into, or just beyond, the same array object are subtracted (6.5.6)

114/120

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)
- the value of the second operand of the / or % operator is zero (6.5.5)
- pointers that do not point into, or just beyond, the same array object are subtracted (6.5.6)
- An array subscript is out of range [...] (6.5.6)

114:100

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)
- conversion between two pointer types produces a result that is incorrectly aligned (6.3.2.3)
- the program attempts to modify a string literal (6.4.5)
- an exceptional condition occurs during the evaluation of an expression (6.5)
- the value of the second operand of the / or % operator is zero (6.5.5)
- pointers that do not point into, or just beyond, the same array object are subtracted (6.5.6)
- An array subscript is out of range [...] (6.5.6)
- the program removes the definition of a macro whose name begins with an underscore and either an uppercase letter or another underscore (7.1.3)

114:100

More examples:

- an identifier [...] contains an invalid multibyte character (5.2.1.2)
- an object is referred to outside of its lifetime (6.2.4)
- the value of a pointer to an object whose lifetime has ended is used (6.2.4)
- conversion to or from an integer type produces a value outside the range that can be represented (6.3.1.4)

- An array subscript is out of range [...] (6.5.6)
- the program removes the definition of a macro whose name begins with an underscore and either an uppercase letter or another underscore (7.1.3)
- etc. pp

114:100

Null-Pointer

```

1 int main() {
2 int* p;
3 *p = 27;
4 return 0;
5 }
```

115:100

Null-Pointer

```

1 int main() {
2 int* p;
3 *p = 27;
4 return 0;
5 }
```

115:100

- "An integer constant expression with the value 0, or such an expression cast to type void\*, is called a **null pointer constant** [...]".
- "The macro **NULL** is defined in <stddef.h> (and other headers) as a null pointer constant; see 7.17."
- "Among the invalid values for dereferencing a pointer by the unary \* operator are a null pointer, [...]" (6.5.3.2)

Segmentation Violation

```

1 int main() {
2 int* p = (int*)0x12345678;
3 *p = 27;
4 *(int*)((void*)p) + 1) = 13;
5 return 0;
6 }
7 }
```

116:100

```

1 int main() {
2 int *p = (int*)0x12345678;
3 *p = 27;
4
5 *(int*)((void*)p) + 1) = 13;
6 return 0;
7 }

```

- Modern operating systems provide **memory protection**
- Accessing memory which the process is not allowed to access is observed by the operating system.
- Typically an instance of "accessing an object outside its lifetime".
- **But:** other way round does not hold
- **But:** other way round does not imply a segmentation violation. accessing an object outside its lifetime does not imply a segmentation violation.

116/120

```

1 int main() {
2 int *p = (int*)0x12345678;
3 *p = 27;
4
5 *(int*)((void*)p) + 1) = 13;
6 return 0;
7 }

```

- Modern operating systems provide **memory protection**
- Accessing memory which the process is not allowed to access is observed by the operating system.
- Typically an instance of "accessing an object outside its lifetime".
- **But:** other way round does not hold.
- **But:** other way round does not imply a segmentation violation. accessing an object outside its lifetime does not imply a segmentation violation.
- Some platforms (e.g. SPARC): unaligned memory access, i.e. outside word boundaries, not supported by hardware ("bus error").
- Operating system notifies process: default handler: terminate, dump core.
