

# Software Design, Modelling and Analysis in UML

## Lecture 06: Type Systems and Visibility

2012-11-13

Prof. Dr. Andreas Podelski, Dr. Bernd Westphal  
Albert-Ludwigs-Universität Freiburg, Germany

### Contents & Goals

- Last Lecture:**
- Representing class diagrams as (extended) signatures — for the moment without associations. (see Lectures 07 and 08)
  - And: in Lecture 03, implicit assumption of well-spreadness of OCL expressions.

**This Lecture:**

- Educational Objectives:** Capabilities for following tasks/questions:
  - Is this OCL expression well typed or not? Why?
  - How/in what form did we define well-definedness?
  - What is visibility good for?
- Content:**
  - Class diagram semantics
  - Stereotypes – for documentation
  - Recall: type theory/static type systems
  - Well-typedness for OCL expression
  - Visibility as a matter of well-spreadness.

2/44

### Extended Classes

- From now on, we assume that each class  $C \in \mathcal{C}$  has
- a finite (possibly empty) set  $S_C$  of **stereotypes**,
  - a boolean flag  $a \in \mathbb{B}$  indicating whether  $C$  is **abstract**,
  - a boolean flag  $t \in \mathbb{B}$  indicating whether  $C$  is **active**.
- We use  $S_C$  to denote the set  $\bigcup_{C \in \mathcal{C}} S_C$  of stereotypes in  $\mathcal{C}$ . (Alternatively, we could add a set  $St$  as 5-th component to  $\mathcal{C}$  to provide the stereotypes (names of stereotypes) to choose from. But: too unimportant to care.)
- Convention:**
- We write  $\langle C, S_C, a, t \rangle \in \mathcal{C}$  when we want to refer to all aspects of  $C$ .
  - If the new aspects are irrelevant (for a given context), we simply write  $C \in \mathcal{C}$ , i.e. old definitions are still valid.

25/44

### Extended Attributes

- From now on, we assume that each attribute  $v \in V$  has (in addition to the type):
- a **visibility**  $\epsilon \in \{\text{public, private, protected, package}\}$
  - an **initial value expr**, given as a word from **language for initial values**, e.g. OCL expressions. (If using Java as **action language** (later), Java expressions would be fine.)
  - a finite (possibly empty) set of **properties**  $P_v$ . We define  $P_v$  analogously to stereotypes.
- Convention:**
- We write  $(v : \tau, \epsilon, \text{expr}, P_v) \in V$  when we want to refer to all aspects of  $v$ .
  - Write only  $v : \tau$  or  $v$  if details are irrelevant.

26/44

### Recall: From Class Boxes to Extended Signatures

3/44

### From Class Boxes to Extended Signatures

A class box  $n$  induces an (extended) signature class as follows:

where

$$V(n) := \{ (v : \tau, \epsilon, S, \{P_1, \dots, P_m\}) \mid (v : \tau, \epsilon, S, \{P_1, \dots, P_m\}) \in \mathcal{C} \}$$

$$a(n) := \begin{cases} \text{true} & \text{if } n = \boxed{C} \\ \text{false} & \text{otherwise} \end{cases}$$

\* "stereoc" is determined by the font:  $\boxed{C}$  or  $\boxed{C}$

\* "active" is determined by the frame:  $\boxed{C}$  or  $\boxed{C}$

29/44

### Class Diagram Semantics

- The semantics of a set of class diagrams  $\mathcal{C} \subseteq \mathcal{D}$  first of all is the induced (extended) signature  $\mathcal{S}(\mathcal{C} \cup \mathcal{D})$ .
- The signature gives rise to a set of system states given a structure  $\mathcal{S}$ .
- Do we need to redefine/extend  $\mathcal{S}$ ? **No.**  
(Would be different if we considered the definition of enumeration types in class diagrams. Then the domain of an enumeration type  $\tau$ , i.e. the set  $\mathcal{D}(\tau)$ , would be determined by the class diagram, and not free for choice.)

### Semantics

- The semantics of a set of class diagrams  $\mathcal{C} \subseteq \mathcal{D}$  first of all is the induced (extended) signature  $\mathcal{S}(\mathcal{C} \cup \mathcal{D})$ .
- The signature gives rise to a set of system states given a structure  $\mathcal{S}$ .
- Do we need to redefine/extend  $\mathcal{S}$ ? **No.**  
(Would be different if we considered the definition of enumeration types in class diagrams. Then the domain of an enumeration type  $\tau$ , i.e. the set  $\mathcal{D}(\tau)$ , would be determined by the class diagram, and not free for choice.)

### Semantics

- The semantics of a set of class diagrams  $\mathcal{C} \subseteq \mathcal{D}$  first of all is the induced (extended) signature  $\mathcal{S}(\mathcal{C} \cup \mathcal{D})$ .
  - The signature gives rise to a set of system states given a structure  $\mathcal{S}$ .
  - Do we need to redefine/extend  $\mathcal{S}$ ? **No.**  
(Would be different if we considered the definition of enumeration types in class diagrams. Then the domain of an enumeration type  $\tau$ , i.e. the set  $\mathcal{D}(\tau)$ , would be determined by the class diagram, and not free for choice.)
  - What is the effect on  $\Sigma_{\mathcal{S}}^{\mathcal{C}}$ ? **Little.**  
For now, we only remove abstract class instances, i.e.  
is now only called system state if and only if, for all  $\langle C, S_C, 1, t \rangle \in \mathcal{C}$ ,  
 $\text{dom}(a) \cap \mathcal{D}(C) = \emptyset$ .
- With  $a = 0$  as default "abstractness", the earlier definitions apply directly. We'll revisit this when discussing inheritance.

### What About The Rest?

- **Classes:**
- **Active:** not represented in  $\sigma$ .
- **Later:** relevant for behaviour, i.e., how system states evolve over time
- **Stereotypes:** in a minute
- **Attributes:**
- **Initial value:** not represented in  $\sigma$ .
- **Later:** provides an initial value as effect of "creation action".
- **Visibility:** not represented in  $\sigma$ .
- **Later:** viewed as additional typing information for well-formedness of system transformers; and with inheritance.
- **Properties:** such as readability, ordered, composite
- **(Deprecated)** in the standard
- **readably** — later treated similar to visibility
- **ordered** — too fine for our representation
- **composite** — cf. lecture on associations.

### Stereotypes

### Stereotypes as Labels or Tags

- So, a class is  $\langle C, S_C, a, t \rangle$  with  $a$  the abstractness flag,  $t$  activeness flag, and  $S_C$  a set of stereotypes.
- What are Stereotypes?
  - **Not** represented in system states
  - **Not** contributing to typing rules (cf. type theory for UML later)
- [Osterwech, 2006]:  
View stereotypes as (additional) "labelling" ("tags") or as "grouping".  
Useful for documentation and MDA.
- **Documentation:** e.g. layers of an architecture.  
Sometimes, packages (cf. the standard) are already sufficient and "right".
- **Model Driven Architecture (MDA):** later.

- Example: Timing Diagram Viewer [Schimam et al., 2009]
- Architecture of four layers:
  - core, data layer
  - abstract view layer
  - toolkit-specific view layer/widget
  - application using widget
- Stereotype "view" layer "colour"

12.44

- Another view (due to whom?): distinguish
- **Technical Inheritance**  
If the **target platform**, such as the programming language for the implementation of the blueprint, is object-oriented, assume a 1-on-1 relation between inheritance in the model and on the target platform.
- **Conceptual Inheritance**  
Only meaningful with a **common idea** of what stereotypes stand for. For instance, one could label each class with the team that is responsible for realising it. Or with licensing information (e.g., LGPL and proprietary).  
Or one could have labels understood by code generators (cf. lecture on MDSE).
- **Confusing:**  
Inheritance is often referred to as the "is a"-relation. Sharing a stereotype also expresses "being something".
- We can always (ab-)use UML-inheritance for the conceptual case, e.g.

13.44

Type Theory

Recall: In lecture 03, we introduced OCL expressions with types, for instance:

```

expr ::= w
      | True | False      : Bool
      | 0 | - | + | * | / : Int
      | expr1 + expr2    : Int × Int → Int ... operation
      | set(expr1)       : Set(T) → Int
  
```

**Wanted:** A procedure to tell **well-typed**, such as ( $w$ : *Bool*)  
 from **not well-typed**, such as,  
 size( $w$ ),

**Approach:** Derivation System, that is, a finite set of derivation rules.  
 We then say *expr* is **well-typed** if and only if we can derive

$A, C \vdash expr : \tau$  (read: "expression *expr* has type  $\tau$ ")

for some OCL type  $\tau$ , i.e.  $\tau \in T_D \cup T_C \cup \{Set(\tau_0) \mid \tau_0 \in T_D \cup T_C\}$ ,  $C \in \mathcal{C}$ . 15.44

A Type System for OCL

A Type System for OCL

These rules will establish well-typedness statements (Type sentences) of three different "qualities":

- (i) Universal well-typedness:
 
$$\vdash expr : \tau$$

$$\vdash 1 + 2 : Int$$
- (ii) Well-typedness in a type environment *A*: (for logical variables)
 
$$A \vdash expr : \tau$$

$$self : TC \vdash self.v : Int$$
- (iii) Well-typedness in type environment *A* and context *B*: (for visibility)
 
$$A, B \vdash expr : \tau$$

$$self : TC, C \vdash self.v : Int$$

16.44

A Type System for OCL

We will give a finite set of **type rules** (a **type system**) of the form

("name")  $\frac{\text{"premise"} \quad \text{"side condition"}}{\text{conclusion}}$

These rules will establish well-typedness statements (Type sentences) of three different "qualities":

- (i) Universal well-typedness:
 
$$\vdash expr : \tau$$

$$\vdash 1 + 2 : Int$$
- (ii) Well-typedness in a type environment *A*: (for logical variables)
 
$$A \vdash expr : \tau$$

$$self : TC \vdash self.v : Int$$
- (iii) Well-typedness in type environment *A* and context *B*: (for visibility)
 
$$A, B \vdash expr : \tau$$

$$self : TC, C \vdash self.v : Int$$

17.44

### Constants and Operations

- If  $expr$  is a **boolean constant**, then  $expr$  is of type  $Bool$ :
 
$$(BOOL) \quad \frac{}{A \vdash Bool} \quad B \in \{true, false\}$$
- If  $expr$  is an **integer constant**, then  $expr$  is of type  $Int$ :
 
$$(INT) \quad \frac{}{A \vdash Int} \quad N \in \{0, 1, -1, \dots\}$$

- If  $expr$  is the application of operation  $w : \tau_1 \times \dots \times \tau_n \rightarrow \tau$  to expressions  $expr_1, \dots, expr_n$  which are of type  $\tau_1, \dots, \tau_n$ , then  $expr$  is of type  $\tau$ :
 
$$(Funs) \quad \frac{A \vdash expr_1 : \tau_1 \dots A \vdash expr_n : \tau_n \quad w : \tau_1 \times \dots \times \tau_n \rightarrow \tau}{A \vdash w(expr_1, \dots, expr_n) : \tau} \quad n \geq 1, w \notin \text{attr}(C)$$
- (Note: this rule also covers '=', 'isEmpty', and 'size')

### Constants and Operations Example

(BOOL)	$\frac{}{A \vdash Bool}$	$B \in \{true, false\}$
(INT)	$\frac{}{A \vdash Int}$	$N \in \{0, 1, -1, \dots\}$
(Funs)	$\frac{A \vdash expr_1 : \tau_1 \dots A \vdash expr_n : \tau_n}{A \vdash w(expr_1, \dots, expr_n) : \tau}$	$w : \tau_1 \times \dots \times \tau_n \rightarrow \tau$ $n \geq 1, w \notin \text{attr}(C)$

- Example:
- not true
 
$$\frac{}{A \vdash not\ true} \quad \frac{}{A \vdash true}$$
  - true + 3
 
$$\frac{}{A \vdash true + 3} \quad \frac{}{A \vdash true} \quad \frac{}{A \vdash 3}$$
  - !true + 3
 
$$\frac{}{A \vdash !true + 3} \quad \frac{}{A \vdash !true} \quad \frac{}{A \vdash 3}$$
  - !(!true + 3)
 
$$\frac{}{A \vdash !(true + 3)} \quad \frac{}{A \vdash true + 3}$$
  - !(!true + 3) \* 2
 
$$\frac{}{A \vdash !(true + 3) * 2} \quad \frac{}{A \vdash !(true + 3)} \quad \frac{}{A \vdash 2}$$
  - !(!true + 3) \* 2 + 3
 
$$\frac{}{A \vdash !(true + 3) * 2 + 3} \quad \frac{}{A \vdash !(true + 3) * 2} \quad \frac{}{A \vdash 3}$$

### Environment Introduction and Logical Variables

- If  $expr$  is of type  $\tau$ , then it is of type  $\tau$  in any type environment:
 
$$(Environ) \quad \frac{}{A \vdash expr : \tau}$$
- Care for logical variables in sub-expressions of operator application:
 
$$(Funs) \quad \frac{A \vdash expr_1 : \tau_1 \dots A \vdash expr_n : \tau_n \quad w : \tau_1 \times \dots \times \tau_n \rightarrow \tau}{A \vdash w(expr_1, \dots, expr_n) : \tau} \quad n \geq 1, w \notin \text{attr}(C)$$
- If  $expr$  is a **logical variable** such that  $w : \tau$  occurs in  $A$ , then we say  $w$  is of type  $\tau$ :
 
$$(Var) \quad \frac{w : \tau \in A}{A \vdash w : \tau}$$

### Type Environment Example

(Environ)	$\frac{}{A \vdash expr : \tau}$
(Funs)	$\frac{A \vdash expr_1 : \tau_1 \dots A \vdash expr_n : \tau_n \quad w : \tau_1 \times \dots \times \tau_n \rightarrow \tau}{A \vdash w(expr_1, \dots, expr_n) : \tau}$
(Var)	$\frac{w : \tau \in A}{A \vdash w : \tau}$

- Example:
- $w + 3, A = w : Int$ 

$$\frac{}{A \vdash w + 3} \quad \frac{}{A \vdash w} \quad \frac{}{A \vdash 3}$$
  - $w + 3 * 2$ 

$$\frac{}{A \vdash w + 3 * 2} \quad \frac{}{A \vdash w + 3} \quad \frac{}{A \vdash 2}$$
  - $!(w + 3) * 2$ 

$$\frac{}{A \vdash !(w + 3) * 2} \quad \frac{}{A \vdash w + 3} \quad \frac{}{A \vdash 2}$$

### Type Environment

- Problem:** Whether  $w + 3$  is well-typed or not depends on the type of logical variable  $w \in W$ .
- Approach:** Type Environments

**Definition.** A type environment is a (possibly empty) finite sequence of type declarations. The set of type environments for a given set  $W$  of logical variables and types  $T$  is defined by the grammar

$$A ::= () \mid A, w : \tau$$

where  $w \in W, \tau \in T$ .

**Clear:** We use this definition for the set of OCL logical variables  $W$  and the types  $T = T_B \cup T_C \cup \{Set(T_B) \mid T_B \in T_B \cup T_C\}$ .

### All Instances and Attributes in Type Environment

- If  $expr$  refers to all instances of class  $C$ , then it is of type  $Set(T_C)$ :
 
$$(AllInst) \quad \frac{}{A \vdash allInst(C) : Set(T_C)}$$
- If  $expr$  is an **attribute access** of an attribute of type  $\tau$  for an object of  $C$  as denoted by  $expr_1$ , then the premise is that  $expr_1$  is of type  $T_C$ :
 
$$(Attr_0) \quad \frac{A \vdash expr_1 : T_C \quad v : \theta \in \text{attr}(C), \tau \in \mathcal{S}}{A \vdash v(expr_1) : \tau}$$

$$(Attr_0^1) \quad \frac{A \vdash expr_1 : T_C \quad r_1 : D_{0,1} \in \text{attr}(C)}{A \vdash r_1(expr_1) : T_C}$$

$$(Attr_0^2) \quad \frac{A \vdash expr_1 : T_C \quad r_2 : D_2 \in \text{attr}(C)}{A \vdash r_2(expr_1) : Set(T_2)}$$

### Attributes in Type Environment Example

$$\begin{array}{l}
 (Attr_0) \quad \frac{A \vdash \text{expr}_1 : \tau_1}{A \vdash (\text{expr}_1) : \tau} \quad v : \tau \in \text{attr}(C), \tau \in \mathcal{T} \\
 (Attr_0^1) \quad \frac{A \vdash \text{expr}_1 : \tau_1 \quad A \vdash \text{expr}_2 : \tau_2 \quad \tau_1, D_{A_1} \in \text{attr}(C)}{A \vdash \tau_1(\text{expr}_1) : \tau_2} \quad \tau_1, D_{A_1} \in \text{attr}(C) \\
 (Attr_1) \quad \frac{A \vdash \text{expr}_1 : \tau_1 \quad A \vdash \text{expr}_2 : \tau_2 \quad \tau_2, D_2 \in \text{attr}(C)}{A \vdash \tau_2(\text{expr}_1) : \tau_2} \quad \tau_2, D_2 \in \text{attr}(C)
 \end{array}$$

24.11

### Iterate

- If  $\text{expr}$  is an **iterate** expression, then
- the reator variable has to be type consistent with the base set, and
- initial and update expressions have to be consistent with the result variable.

$$(Iter) \quad \frac{A \vdash \text{expr}_1 : \tau_1 \quad A \vdash \text{expr}_2 : \tau_2 \quad A \vdash \text{expr}_3 : \tau_3}{A \vdash \text{iterate}(u_1, \tau_1; u_2, \tau_2; \text{expr}_2) : \tau_3}$$

where  $A' = A \oplus (u_1 : \tau_1) \oplus (u_2 : \tau_2)$

Handwritten notes: 'reator typing of  $u_1, u_2$  in  $A'$ ', 'iterate typing of  $u_1, u_2$  in  $A'$ ', 'iterate typing of  $u_1, u_2$  in  $A'$ ', 'iterate typing of  $u_1, u_2$  in  $A'$ '.

25.11

### Iterate Example

$$\begin{array}{l}
 (Attr_{base}) \quad \frac{A \vdash \text{base} : \tau}{A \vdash \text{iterate}(u_1, \tau; u_2, \tau; \text{base}) : \tau} \\
 (Iter) \quad \frac{A \vdash \text{expr}_1 : \tau_1 \quad A \vdash \text{expr}_2 : \tau_2 \quad A \vdash \text{expr}_3 : \tau_3}{A \vdash \text{iterate}(u_1, \tau_1; u_2, \tau_2; \text{expr}_2) : \tau_3}
 \end{array}$$

where  $A' = A \oplus (u_1 : \tau_1) \oplus (u_2 : \tau_2)$

Example:  $\mathcal{C} = \{(Int), \{C\}, \{x : Int\}, \{C \vdash \{x\}\}\}$

$$\frac{A \vdash \text{base} : \tau \quad A \vdash \text{expr}_1 : \tau_1 \quad A \vdash \text{expr}_2 : \tau_2 \quad A \vdash \text{expr}_3 : \tau_3}{A \vdash \text{iterate}(u_1, \tau_1; u_2, \tau_2; \text{expr}_2) : \tau_3}$$

Handwritten notes: 'A ⊢ base : τ', 'A ⊢ expr<sub>1</sub> : τ<sub>1</sub>', 'A ⊢ expr<sub>2</sub> : τ<sub>2</sub>', 'A ⊢ expr<sub>3</sub> : τ<sub>3</sub>', 'A ⊢ iterate(u<sub>1</sub>, τ<sub>1</sub>; u<sub>2</sub>, τ<sub>2</sub>; expr<sub>2</sub>) : τ<sub>3</sub>'.

26.11

### First Recapitulation

- I only defined for well-typed expressions.
- What can hinder something, which looks like a well-typed OCL expression, from being a well-typed OCL expression...?

$\mathcal{C} = \{(Int), \{C, D\}, \{x : Int, n : D_{A,1}\}, \{C \vdash \{x\}, \{D \vdash \{x\}\}\}$

Handwritten notes: 'inv', 'context C ⊢ inv : D = 0', 'inv', 'context C ⊢ inv : D = 0', 'inv', 'context C ⊢ inv : D = 0'.
