Software Design, Modelling and Analysis in UML

Lecture 10: Constructive Behaviour, State Machines Overview

2013-12-02

Prof. Dr. Andreas Podelski, Dr. Bernd Westphal

Albert-Ludwigs-Universität Freiburg, Germany

Contents & Goals

Last Lecture:

• (Mostly) completed discussion of modelling structure.

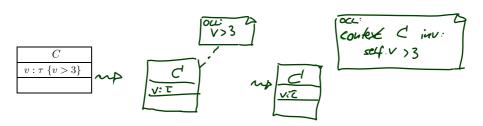

This Lecture:

- Educational Objectives: Capabilities for following tasks/questions.
 - Discuss the style of this class diagram.
 - What's the difference between reflective and constructive descriptions of behaviour?
 - What's the purpose of a behavioural model?
 - What does this State Machine mean? What happens if I inject this event?
 - Can you please model the following behaviour.

• Content:

- For completeness: Modelling Guidelines for Class Diagrams
- Purposes of Behavioural Models
- Constructive vs. Reflective
- UML Core State Machines (first half)

Invariant in Class Diagram Example

If $\mathscr{C}\mathscr{D}$ consists of only $\mathcal{C}\mathcal{D}$ with the single class C , then

•
$$Inv(\mathscr{C}\mathscr{D}) = Inv(\mathcal{C}\mathcal{D}) = \{ context \ C \ inv: v > 3 \ \}$$

- 10 - 2013-12-02 - SocIdia -

Constraints vs. Types

Find the 10 differences:

C	
$x: Int \{x = 3 \lor x > 17\}$	x:T

$$C$$

$$x:T$$

$$\emptyset(T) = \{3$$

$$\cup \{n \in \mathbb{N}\}$$

$$\mathcal{D}(T) = \{3\}$$

$$\cup \{n \in \mathbb{N} \mid n > 17\}$$

- x = 4 is well-typed in the left context, a system state satisfying x=4 violates the constraints of the diagram.
- x = 4 is not even well-typed in the right context, there cannot be a system state with $\sigma(u)(x) = 4$ because $\sigma(u)(x)$ is supposed to be in $\mathcal{D}(T)$ (by definition of system state).

Rule-of-thumb:

- If something "feels like" a type (one criterion: has a natural correspondence in the application domain), then make it a type.
- If something is a requirement or restriction of an otherwise useful type, then make it a constraint.

5/96

Semantics of a Class Diagram

Definition. Let \mathscr{CD} be a set of class diagrams.

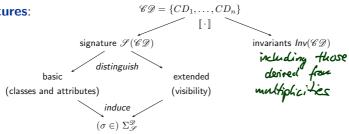

We say, the semantics of $\mathscr{C}\mathscr{D}$ is the signature it induces and the set of OCL constraints occurring in \mathscr{CD} , denoted

$$[\![\mathscr{C}\mathscr{D}]\!] := \langle \mathscr{S}(\mathscr{C}\mathscr{D}), \mathit{Inv}(\mathscr{C}\mathscr{D}) \rangle.$$

Given a structure $\mathscr D$ of $\mathscr S$ (and thus of $\mathscr C\mathscr D$), the class diagrams describe the system states $\Sigma_{\mathscr{L}}^{\mathscr{D}}$. Of those, **some** satisfy $Inv(\mathscr{C}\mathscr{D})$ and some don't.

We call a system state $\sigma \in \Sigma_{\mathscr{S}}^{\mathscr{D}}$ consistent if and only if $\sigma \models \mathit{Inv}(\mathscr{C}\mathscr{D})$.

In pictures:

Recall: a UML model is an image or pre-image of a software system.

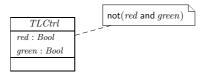

A set of class diagrams \mathscr{CD} with invariants $\mathit{Inv}(\mathscr{CD})$ describes the **structure** of system states.

Together with the invariants it can be used to state:

- **Pre-image**: Dear programmer, please provide an implementation which uses only system states that satisfy $Inv(\mathscr{C}\mathscr{D})$.
- **Post-image**: Dear user/maintainer, in the existing system, only system states which satisfy $Inv(\mathscr{C}\mathscr{D})$ are used.

(The exact meaning of "use" will become clear when we study behaviour — intuitively: the system states that are reachable from the initial system state(s) by calling methods or firing transitions in state-machines.)

Example: highly abstract model of traffic lights controller.

7/96

Addendum: Semantics of OCL Boolean Operations

10 - 2013-12-02 - Socidia -

$$T(t)(x,y) = \begin{cases} x+y, & \text{if } x+1 \text{ and } y+1 \\ \bot, & \text{otherwise} \end{cases}$$

o if $I(\alpha)(p,q) = \begin{cases} true, & \text{if } p=true \text{ or } q=true \text{ and } p \neq L \text{ and } q \neq L \end{cases}$

then not octUndefined (self.n) imply sef.n.x>0 ccl Undefined (self.h) or self.n.x>0 would not do what we want

9/96

Correct Semantics of OCL Boolean Operations

Table A.2 - Semantics of boolean operations

b_1	b_2	b_1 and b_2	<i>b</i> 1 or <i>b</i> 2	$b_1 \operatorname{xor} b_2$	b_1 implies b_2	not b_1
false	false	false	false	false	true	true
false	true	false	true	true	true	true
true	false	false	true	true	false	false
true	true	true	true	false	true	false
false	1	false	Τ	Τ	true	true
true	1	1	true	1	1	false

Table A.2 - Semantics of boolean operations

Object Constraint Language, v2.0

	Τ	false	false	1	Τ	Τ	Τ
 	Τ	true	1	true	1	true	Τ
Ĭ	Τ	1	1	1	1	Τ	Τ

Design Guidelines for (Class) Diagram

(partly following [Ambler, 2005])

Be careful whose advice you buy, but, be patient with those who supply it.

Baz Luhrmann/Mary Schmich

11/96

Main and General Modelling Guideline (admittedly: trivial and obvious)

Be good to your audience.

"Imagine you're given your diagram \mathcal{D} and asked to conduct task \mathcal{T} .

- Can you do ${\cal T}$ with ${\cal D}$? (semantics sufficiently clear? all necessary information available? ...)
- Does doing T with D cost you more nerves/time/money/...than it should?"
 (syntactical well-formedness? readability? intention of deviations from standard syntax clear? reasonable selection of information? layout? ...)

In other words:

answer should be

- the things most relevant for \mathcal{T} , do they stand out in \mathcal{D} ?

10 - 2013-12-02 - main -

0 - 2013-12-02 - Selements -

- Q: When is a (class) diagram a good diagram?
- A: If it serves its purpose/makes its point.

Examples for purposes and points and rules-of-thumb:

- Analysis/Design
 - · realizable, no contradictions
 - abstract, focused, admitting degrees of freedom for (more detailed) design
 - platform independent as far as possible but not (artificially) farer
- Implementation/A
 - close to target platform $(C_{0,1}$ is easy for Java, C_* comes at a cost other way round for RDB)
- Implementation/B
 - complete, executable
- Documentation
 - Right level of abstraction: "if you've only one diagram to spend, illustrate the concepts, the architecture, the difficult part"
 - The more detailed the documentation, the higher the probability for regression "outdated/wrong documentation is worse than none"

General Diagramming Guidelines [Ambler, 2005]

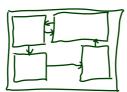

(Note: "Exceptions prove the rule.")

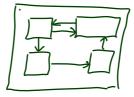

- 1.-3. Support Readability of Lines
- 4. Apply Consistently Sized Symbols —
- 9. Minimize the Number of Bubbles/Things
- 10. Include White-Space in Diagrams

γs

10 - 2013-12-02 - Selements -

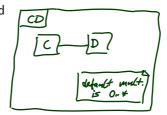

13/96

General Diagramming Guidelines [Ambler, 2005]

(Note: "Exceptions prove the rule.")

• 2.1 Readability

- 1.–3. Support Readability of Lines
- 4. Apply Consistently Sized Symbols
- 9. Minimize the Number of Bubbles
- 10. Include White-Space in Diagrams
- 13. Provide a Notational Legend

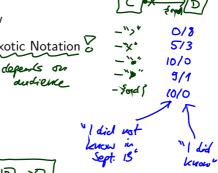

14/96

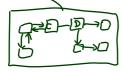

General Diagramming Guidelines [Ambler, 2005]

• 2.2 Simplicity

- 14. Show Only What You Have to Show
- 15. Prefer Well-Known Notation over Exotic Notation \$\overline{\cappa}\$
- 16. Large vs. Small Diagrams

• 18. Content First, Appearance Second

7013-12-02 — Selements —

General Diagramming Guidelines [Ambler, 2005]

• 2.2 Simplicity

- 14. Show Only What You Have to Show
- 15. Prefer Well-Known Notation over Exotic Notation
- 16. Large vs. Small Diagrams
- 18. Content First, Appearance Second

• 2.3 Naming

• 20. Set and (23. Consistently) Follow Effective Naming Conventions

• 2.4 General

- 24. Indicate Unknowns with Question-Marks
- 25. Consider Applying Color to Your Diagram
- 26. Apply Color Sparingly

15/96

Class Diagram Guidelines [Ambler, 2005]

• 5.1 General Guidelines

• 88. Indicate Visibility Only on Design Models (in contrast to analysis models)

• 5.2 Class Style Guidelines

- 96. Prefer Complete Singular Nouns for Class Names
- 97. Name Operations with Strong Verbs
- 99. Do Not Model Scaffolding Code [Except for Exceptions]

ex get/set vethods

10 - 2013-12-02 - Selements -

Class Diagram Guidelines [Ambler, 2005]

fine vs. C

• 5.2 Class Style Guidelines

- 103. Never Show Classes with Just Two Compartments
- 104. Label Uncommon Class Compartments •

C' f: Int g(): but

f();ht

- ullet ullet 105. Include an Ellipsis (...) at the End of an Incomplete List
- 107. List Operations/Attributes in Order of Decreasing Visibility

C' «oveits» E,F

X: ht y: ht

17/96

Class Diagram Guidelines [Ambler, 2005]

• 5.3 Relationships

• 112. Model Relationships Horizontally

- 115. Model a Dependency When the Relationship is Transitory
- 117. Always Indicate the Multiplicity (or have joed defaults)
- 118. Avoid Multiplicity "*" (explicitly use O" → or 1" *)
- 119. Replace Relationship Lines with Attribute Types (to have few lines)

- 2013-12-02 - Selements -

Class Diagram Guidelines [Ambler, 2005]

• 5.4 Associations

- 127. Indicate Role Names When Multiple Associations Between Two Classes Exist
- 129. Make Associations Bidirectional Only When Collaboration Occurs in Both Directions
- 131. Avoid Indicating Non-Navigability (is weart to be ()**
- 133. Question Multiplicities Involving Minimums(and Maximums)
- 5.6 Aggregation and Composition
- 7 3.0 7 Aggregation and Composit
 - $\bullet \ \to \ \text{exercises}$

19/96

[...] But trust me on the sunscreen.

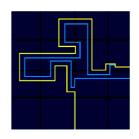

Baz Luhrmann/Mary Schmich

Task: Game Development

Task: develop a video game. Genre: Racing. Rest: open, i.e.

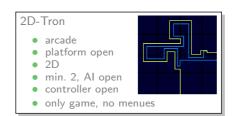

Degrees of freedom:	Exemplary choice: 2D-Tron
 simulation vs. arcade 	arcade
 platform (SDK or not, open or proprietary, hardware capabilities) 	open
• graphics (3D, 2D,)	2D
 number of players, Al 	min. 2, Al open
controller	open (later determined by platform)
 game experience 	minimal: main menu and game

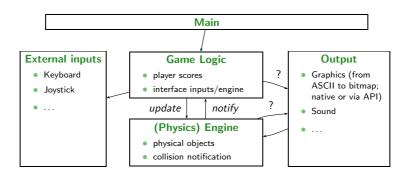

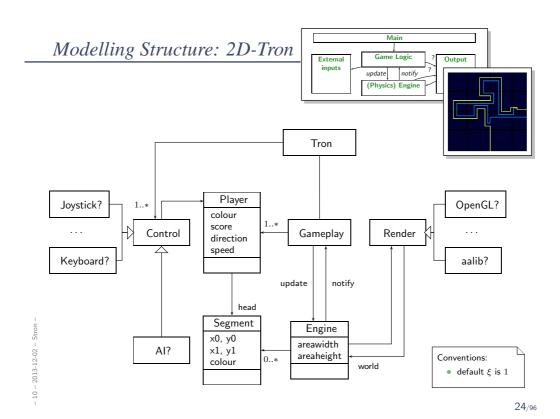

Modelling Structure: 2D-Tron

- In many domains, there are canonical architectures – and adept readers try to see/find/match this!
- For games:

23/96

Modelling Behaviour

10 - 2013-12-02 - main -

25/96

Stocktaking...

Have: Means to model the **structure** of the system.

- Class diagrams graphically, concisely describe sets of system states.
- OCL expressions logically state constraints/invariants on system states.

Want: Means to model behaviour of the system.

 Means to describe how system states evolve over time, that is, to describe sets of sequences

$$\sigma_0, \sigma_1, \dots \in \Sigma^{\omega}$$

of system states.

 $\cdot \in \Sigma^{\omega}$ not real-time, just counting steps here

- 10 - 2013-12-02 - Shehav -

What Can Be Purposes of Behavioural Models?

(We will discuss this in more detail in Lecture 22.)

Example: Pre-Image Image

(the UML model is supposed to be the blue-print for a software system).

A description of behaviour could serve the following purposes:

• Require Behaviour. "System definitely does this"

"This sequence of inserting money and requesting and getting water must be possible."

(Otherwise the software for the vending machine is completely broken.)

Allow Behaviour. "System does subset of this"

"After inserting money and choosing a drink, the drink is dispensed (if in stock)." (If the implementation insists on taking the money first, that's a fair choice.)

• Forbid Behaviour. "System never does this"

"This sequence of getting both, a water and all money back, must not be possible." (Otherwise the software is broken.)

Note: the latter two are trivially satisfied by doing nothing...

28/96

Constructive vs. Reflective Descriptions

[Harel, 1997] proposes to distinguish constructive and reflective descriptions:

- "A language is **constructive** if it contributes to the dynamic semantics of the model. That is, its constructs contain information needed in executing the model or in translating it into executable code."
 - A constructive description tells **how** things are computed (which can then be desired or undesired).
- "Other languages are reflective or assertive, and can be used by the system modeler to capture parts of the thinking that go into building the model – behavior included –, to derive and present views of the model, statically or during execution, or to set constraints on behavior in preparation for verification."

A reflective description tells **what** shall or shall not be computed.

Note: No sharp boundaries!

2013-12-02 - Sbehav -

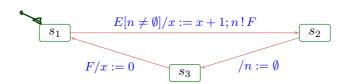

Constructive UML

UML provides two visual formalisms for constructive description of behaviours:

- Activity Diagrams
- State-Machine Diagrams

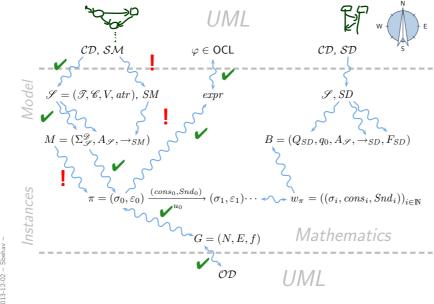

We (exemplary) focus on State-Machines because

- somehow "practice proven" (in different flavours),
- prevalent in embedded systems community,
- indicated useful by [Dobing and Parsons, 2006] survey, and
- Activity Diagram's intuition changed (between UML 1.x and 2.x) from transition-system-like to petri-net-like...
- Example state machine:
