

Software Design, Modelling and Analysis in UML

Lecture 09: Class Diagrams III

2013-11-25

Prof. Dr. Andreas Podelski, **Dr. Bernd Westphal**

Albert-Ludwigs-Universität Freiburg, Germany

- 09 - 2013-11-25 - main -

Contents & Goals

Last Lectures:

- Studied syntax and semantics of associations in the general case.

This Lecture:

- **Educational Objectives:** Capabilities for following tasks/questions.
 - Cont'd: Please explain this class diagram with associations.
 - When is a class diagram a good class diagram?
 - What are purposes of modelling guidelines? (Example?)
 - Discuss the style of this class diagram.
- **Content:**
 - Effect of association semantics on OCL.
 - Treat "the rest".
 - Where do we put OCL constraints?
 - Modelling guidelines, in particular for class diagrams (following [Ambler, 2005])
 - Examples: modelling games (made-up and real-world examples)

- 09 - 2013-11-25 - Prelim -

Links in System States

$$\langle r : \langle role_1 : C_1, \neg, P_1, \neg, \neg, \neg \rangle, \dots, \langle role_n : C_n, \neg, P_n, \neg, \neg, \neg \rangle \rangle$$

Only for the course of lectures 08/09 we change the definition of system states:

Definition. Let \mathcal{D} be a structure of the (extended) signature $\mathcal{S} = (\mathcal{T}, \mathcal{C}, V, atr)$.

A **system state** of \mathcal{S} wrt. \mathcal{D} is a pair (σ, λ) consisting of

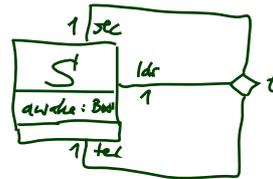

- a type-consistent mapping $\sigma : \mathcal{D}(\mathcal{C}) \rightarrow (atr(\mathcal{C}) \rightarrow \mathcal{D}(\mathcal{T}))$,
 - values for basic type attributes only
- a mapping λ which assigns each association $\langle r : \langle role_1 : C_1 \rangle, \dots, \langle role_n : C_n \rangle \rangle \in V$ a relation $\lambda(r) \subseteq \mathcal{D}(C_1) \times \dots \times \mathcal{D}(C_n)$ (i.e. a set of type-consistent n -tuples of identities).

for associations

- 08 - 2013-11-20 - Sasoceem -

Example

$\langle t : \langle ldr : S \rangle$
 $\langle sec : S \rangle$
 $\langle ter : S \rangle \rangle$

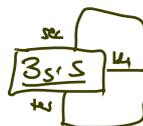

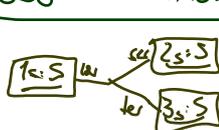

$\sigma = \{ 1_s \mapsto \{ name \mapsto '1' \}, 2_s \mapsto \{ name \mapsto '0' \}, 3_s \mapsto \{ name \mapsto '1' \}, 27_s \mapsto \{ name \mapsto '0' \} \}$

$\lambda = \{ t \mapsto \{ \begin{matrix} \downarrow ldr & \downarrow sec & \downarrow ter \\ (1_s, 2_s, 3_s), & & \\ (1_s, 27_s, 3_s), & & \\ (2_s, 5_s, 6_s), & & \\ (3_s, 3_s, 3_s) \end{matrix} \} \}$

students may join multiple groups
 links may also have dangling references
 one student may assume all roles
 (add a constraint if this is not desired)

OBJECT DIAGRAMS:

\hookrightarrow we need hyperedges in general

WE WILL NOT FORMALLY DEFINE THAT

Association/Link Example

Signature:

$$\mathcal{S} = (\{Int\}, \{C, D\}, \{x : Int\}, \langle A_C_D : \langle c : C, 0..*, +, \{\text{unique}\}, \times, 1 \rangle, \langle n : D, 0..*, +, \{\text{unique}\}, >, 0 \rangle \rangle, \{C \mapsto \emptyset, D \mapsto \{x\}\})$$

by convention (pointing to \times)
by default (pointing to $>$)

A **system state** of \mathcal{S} (some reasonable \mathcal{D}) is (σ, λ) with:

$$\sigma = \{1_C \mapsto \emptyset, 3_D \mapsto \{x \mapsto 1\}, 7_D \mapsto \{x \mapsto 2\}\}$$

$$\lambda = \{A_C_D \mapsto \{(1_C, 3_D), (1_C, 7_D)\}\}$$

object 1_C is related to 3_D and 7_D by A-C-N

Associations and OCL

OCL and Associations: Syntax

Recall: OCL syntax as introduced in Lecture 03, interesting part:

$expr ::= \dots$	$ r_1(expr_1) : \tau_C \rightarrow \tau_D$	$r_1 : D_{0,1} \in atr(C)$
	$ r_2(expr_1) : \tau_C \rightarrow Set(\tau_D)$	$r_2 : D_* \in atr(C)$

Now becomes

$expr ::= \dots$	$ role(expr_1) : \tau_C \rightarrow \tau_D$	$\mu = 0..1$ or $\mu = 1$
	$ role(expr_1) : \tau_C \rightarrow Set(\tau_D)$	otherwise

if there is

$\langle r : \dots, \langle role : D, \mu, -, -, -, - \rangle, \dots, \langle role' : C, -, -, -, -, - \rangle, \dots \rangle \in V$ or
 $\langle r : \dots, \langle role' : C, -, -, -, -, - \rangle, \dots, \langle role : D, \mu, -, -, -, - \rangle, \dots \rangle \in V, \underline{role \neq role'}$

two rows for tech. reasons: order matters

$C \xrightarrow{\mu} D$: never $h(set_D)$
 $C \xrightarrow{\mu} \boxed{D}$: $n(set_C)$ is ok

-09 - 2013-11-25 - Sarsoccl -

4/45

OCL and Associations: Syntax

Recall: OCL syntax as introduced in Lecture 03, interesting part:

$expr ::= \dots$	$ r_1(expr_1) : \tau_C \rightarrow \tau_D$	$r_1 : D_{0,1} \in atr(C)$
	$ r_2(expr_1) : \tau_C \rightarrow Set(\tau_D)$	$r_2 : D_* \in atr(C)$

Now becomes

$expr ::= \dots$	$ role(expr_1) : \tau_C \rightarrow \tau_D$	$\mu = 0..1$ or $\mu = 1$
	$ role(expr_1) : \tau_C \rightarrow Set(\tau_D)$	otherwise

if

$\langle r : \dots, \langle role : D, \mu, -, -, -, - \rangle, \dots, \langle role' : C, -, -, -, -, - \rangle, \dots \rangle \in V$ or
 $\langle r : \dots, \langle role' : C, -, -, -, -, - \rangle, \dots, \langle role : D, \mu, -, -, -, - \rangle, \dots \rangle \in V, \underline{role \neq role'}$

Note:

- Association name as such doesn't occur in OCL syntax, role names do.
- $expr_1$ has to denote an object of a class which "participates" in the association.

-09 - 2013-11-25 - Sarsoccl -

4/45

OCL and Associations Syntax: Example

$expr ::= \dots \mid role(expr_1) : \tau_C \rightarrow \tau_D \quad \mu = 0..1 \text{ or } \mu = 1$
 $\mid role(expr_1) : \tau_C \rightarrow Set(\tau_D) \quad \text{otherwise}$

if
 $\langle r : \dots, \langle role : D, \mu, _ , _ , _ \rangle, \dots, \langle role' : C, _ , _ , _ , _ \rangle, \dots \rangle \in V$ or
 $\langle r : \dots, \langle role' : C, _ , _ , _ , _ \rangle, \dots, \langle role : D, \mu, _ , _ , _ \rangle, \dots \rangle \in V, role \neq role'$.

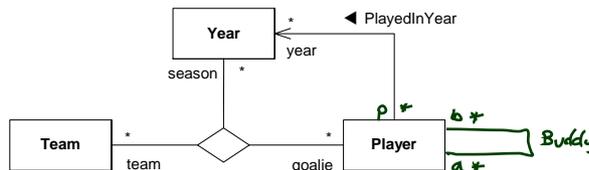

Figure 7.21 - Binary and ternary associations [OMG, 2007b, 44].

- context *Player* inv: size(year(self)) > 0 OK
- context *Player* inv: self.p → size > 0 NOT OK
- context *Player* inv: self.season → size > 0 OK
- context *Player* inv: self.b → size > 0 OK

- 08 - 2011-12-06 - Sasooccl -

10/53

OCL and Associations: Semantics

Recall: (Lecture 03)

Assume $expr_1 : \tau_C$ for some $C \in \mathcal{C}$. Set $u_1 := I[expr_1](\sigma, \beta) \in \mathcal{D}(\tau_C)$.

- $I[r_1(expr_1)](\sigma, \beta) := \begin{cases} u & , \text{ if } u_1 \in \text{dom}(\sigma) \text{ and } \sigma(u_1)(r_1) = \{u\} \\ \perp & , \text{ otherwise} \end{cases}$
- $I[r_2(expr_1)](\sigma, \beta) := \begin{cases} \sigma(u_1)(r_2) & , \text{ if } u_1 \in \text{dom}(\sigma) \\ \perp & , \text{ otherwise} \end{cases}$

$\in \mathcal{D}(D)$

Now needed:

$$I[role(expr_1)](\underline{\sigma}, \lambda, \beta)$$

- We cannot simply write $\sigma(u)(role)$.
Recall: *role* is **(for the moment)** not an attribute of object u (not in $atr(C)$).
- What we have is $\lambda(r)$ (with r , not with *role*!) — but it yields a set of n -tuples, of which **some** relate u and other some instances of D .
- *role* denotes the position of the D 's in the tuples constituting the value of r .

- 09 - 2013-11-25 - Sasooccl -

5/45

OCL and Associations: Semantics Cont'd

Assume $expr_1 : \tau_C$ for some $C \in \mathcal{C}$. Set $u_1 := I[expr_1]((\sigma, \lambda), \beta) \in \mathcal{D}(\tau_C)$.

- $I[role(expr_1)]((\sigma, \lambda), \beta) := \begin{cases} u & , \text{ if } u_1 \in \text{dom}(\sigma) \text{ and } L(role)(u_1, \lambda) = \{u\} \\ \perp & , \text{ otherwise} \end{cases} \quad \mu=1 \text{ or } \mu=0..1$
- $I[role(expr_1)]((\sigma, \lambda), \beta) := \begin{cases} L(role)(u_1, \lambda) & , \text{ if } u_1 \in \text{dom}(\sigma) \\ \perp & , \text{ otherwise} \end{cases}$

where

$$L(role)(u, \lambda) = \{(u_1, \dots, u_n) \in \lambda(r) \mid u \in \{u_1, \dots, u_n\} \downarrow i\} \subseteq \mathcal{D}(\mathcal{E})$$

Handwritten annotations:
 - "role name" points to $role$
 - "object identifs" points to u_1, \dots, u_n
 - "links" points to $\lambda(r)$
 - "projection on the i-th component" points to $\downarrow i$

if

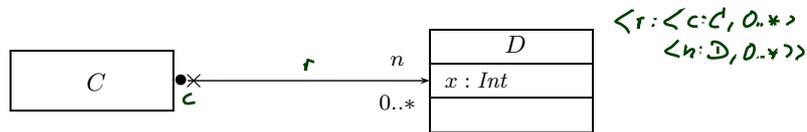

$$\langle r : \dots \langle role_1 : \rightarrow, \rightarrow, \rightarrow, \rightarrow, \rightarrow \rangle, \dots \langle role_n : \rightarrow, \rightarrow, \rightarrow, \rightarrow, \rightarrow \rangle, \dots \rangle, \underline{role = role_i.}$$

Given a set of n -tuples A , $A \downarrow i$ denotes the element-wise projection onto the i -th component.

OCL and Associations Example

$$I[role(expr_1)]((\sigma, \lambda), \beta) := \begin{cases} L(role)(u_1, \lambda) & , \text{ if } u_1 \in \text{dom}(\sigma) \\ \perp & , \text{ otherwise} \end{cases}$$

$$L(role)(u, \lambda) = \{(u_1, \dots, u_n) \in \lambda(r) \mid u \in \{u_1, \dots, u_n\} \downarrow i\}$$

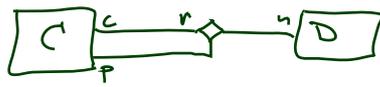

$$\sigma = \{1_C \mapsto \emptyset, 3_D \mapsto \{x \mapsto 1\}, 7_D \mapsto \{x \mapsto 2\}\} \cup \{2_C \mapsto \emptyset\}$$

$$\lambda = \{ \cancel{1_C} \mapsto \{(1_C, 3_D), (1_C, 7_D)\} \cup \{(2_C, 7_D)\} \}$$

$$I[self.n]((\sigma, \lambda), \{self \mapsto 1_C\}) = \{3_D, 7_D\}$$

Handwritten annotations:
 - "all tuples where 1c occurs" points to $\{(1_C, 3_D), (1_C, 7_D)\}$
 - "position of role n in r" points to $\downarrow 2$
 - $(= L(n)(1_C, \lambda))$
 - $= \{(1_C, 3_D), (1_C, 7_D)\} \downarrow 2$
 - $= \{3_D, 7_D\}$

$\langle r: \langle C: C \rangle, \langle n: D \rangle, \langle p: C \rangle \rangle$

$$\lambda = \{ r \mapsto \{ (1_C, 3_D, 1_C), (4_C, 7_D, 2_C), (1_C, 8_D, 2_C), (5_C, 9_D, 6_C) \} \}$$

$$\mathcal{L}(u)(1_C, \lambda) = \{ (1_C, 3_D, 1_C), (1_C, 8_D, 2_C) \} \downarrow \lambda = \{ 3_D, 8_D \}$$

$$\mathcal{L}(u)(2_C, \lambda) = \{ 7_D, 8_D \}$$

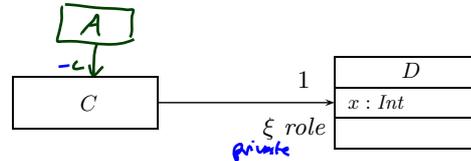

$$\mathcal{L}(u)(5_C, \lambda) = \{ 9_D \}$$

Associations: The Rest

Visibility

Not so surprising: Visibility of role-names is treated completely similar to visibility of attributes, namely by **typing rules**.

Question: given

self_A.c OK
self_A.c.role NOT OK
self_C.role OK

is the following OCL expression well-typed or not (wrt. visibility):

context C inv : $self.role.x > 0$

Basically same rule as before: (analogously for other multiplicities)

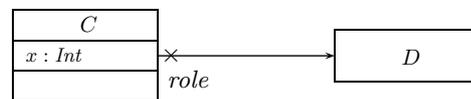

$$(Assoc_1) \frac{A, B \vdash expr_1 : \tau_C}{A, B \vdash role(expr_1) : \tau_D}, \quad \begin{array}{l} \mu = 0..1 \text{ or } \mu = 1, \\ \xi = +, \text{ or } \xi = - \text{ and } C = B \end{array}$$

$$\langle r : \dots \langle role : D, \mu, \xi, \dots \rangle, \dots \langle role' : C, \dots, \dots \rangle, \dots \rangle \in V$$

Navigability

Navigability is similar to visibility: expressions over non-navigable association ends ($\nu = \times$) are **basically** type-correct, but **forbidden**.

Question: given

is the following OCL expression well-typed or not (wrt. navigability):

context D inv : $self.role.x > 0$ *NOT well-typed*

The standard says:

- '-': navigation is possible
- '>': navigation is efficient
- 'x': navigation is not possible

depends on context, eg. slow vs fast database, needs to be communicated to developers

So: In general, UML associations are different from pointers/references!

But: Pointers/references can faithfully be modelled by UML associations.

The Rest

Recapitulation: Consider the following association:

$$\langle r : \langle role_1 : C_1, \mu_1, P_1, \xi_1, \nu_1, o_1 \rangle, \dots, \langle role_n : C_n, \mu_n, P_n, \xi_n, \nu_n, o_n \rangle \rangle$$

- Association name r and role names/types $role_i/C_i$ induce extended system states λ .
- Multiplicity μ is considered in OCL syntax.
- Visibility ξ and navigability ν give rise to well-typedness rules.

Now the rest:

- Multiplicity μ : we propose to view them as constraints.
- Properties P_i : even more typing.
- Ownership o : getting closer to pointers/references.
- Diamonds: exercise.

-09-2013-11-25 - Sesoocrest -

11/45

Multiplicities as Constraints

Recall: The multiplicity of an association end is a term of the form:

$$\mu ::= * \mid N \mid N..M \mid N..* \mid \mu, \mu \quad (N, M \in \mathbb{N})$$

Proposal: View multiplicities (except 0..1, 1) as additional invariants/constraints.

Recall: we can normalize each multiplicity to the form

$$\mu = N_1..N_2, \dots, N_{2k-1}..N_{2k}$$

where $N_i \leq N_{i+1}$ for $1 \leq i \leq 2k$, $N_1, \dots, N_{2k} \in \mathbb{N}$, $N_{2k} \in \mathbb{N} \cup \{*\}$.

Define

$\mu_{\text{OCL}} = \text{context } C \text{ inv :}$

$$(N_1 \leq \text{role} \rightarrow \text{size}() \leq N_2) \text{ ~~and~~ } \dots \text{ ~~and~~ } (N_{2k-1} \leq \text{role} \rightarrow \text{size}() \leq N_{2k})$$

for each

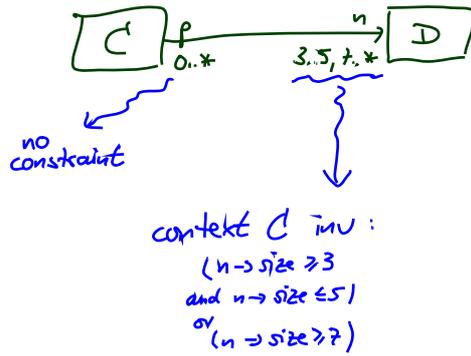

$$\langle r : \dots, \langle role : D, \mu, \rightarrow, \rightarrow, \rightarrow, \rightarrow \rangle, \dots, \langle role' : C, \rightarrow, \rightarrow, \rightarrow, \rightarrow \rangle, \dots \rangle \in V \text{ or}$$

$$\langle r : \dots, \langle role' : C, \rightarrow, \rightarrow, \rightarrow, \rightarrow \rangle, \dots, \langle role : D, \mu, \rightarrow, \rightarrow, \rightarrow, \rightarrow \rangle, \dots \rangle \in V, \text{role} \neq \text{role}'.$$

Note: in n -ary associations with $n > 2$, there is redundancy.

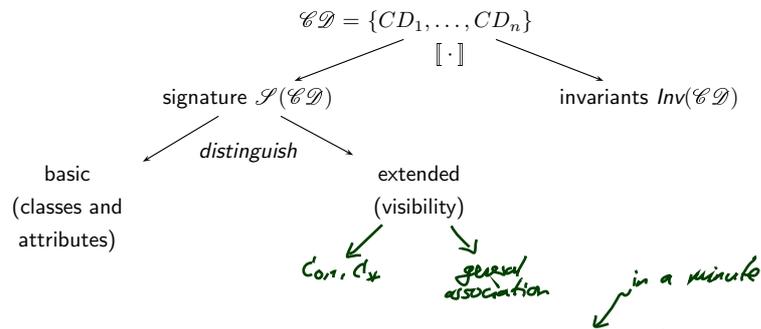

-09-2013-11-25 - Sesoocrest -

12/45

Multiplicities as Constraints of Class Diagram

Recall:

From now on: $Inv(\mathcal{CD}) = \{\text{constraints occurring in notes}\} \cup \{\mu\text{OCL} \mid$

$$\langle r : \dots, \langle \text{role} : D, \mu, _ , _ , _ \rangle, \dots, \langle \text{role}' : C, _ , _ , _ , _ \rangle, \dots \rangle \in V \text{ or}$$

$$\langle r : \dots, \langle \text{role}' : C, _ , _ , _ , _ \rangle, \dots, \langle \text{role} : D, \mu, _ , _ , _ \rangle, \dots \rangle \in V,$$

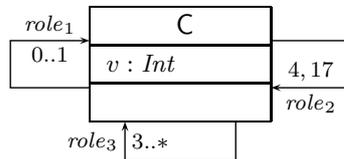

$$\text{role} \neq \text{role}', \mu \notin \{0..1, 1\}.$$

Multiplicities as Constraints Example

$\mu_{\text{OCL}} = \text{context } C \text{ inv :}$

$(N_1 \leq \text{role} \rightarrow \text{size}() \leq N_2) \text{ and } \dots \text{ and } (N_{2k-1} \leq \text{role} \rightarrow \text{size}() \leq N_{2k})$

\mathcal{CD} :

$\text{Inv}(\mathcal{CD}) =$

- $\{\text{context } C \text{ inv : } 4 \leq \text{role}_2 \rightarrow \text{size}() \leq 4 \text{ or } 17 \leq \text{role}_2 \rightarrow \text{size}() \leq 17\}$
 $= \{\text{context } C \text{ inv : } \text{role}_2 \rightarrow \text{size}() = 4 \text{ or } \text{role}_2 \rightarrow \text{size}() = 17\}$
- $\cup \{\text{context } C \text{ inv : } 3 \leq \text{role}_3 \rightarrow \text{size}()\}$

-09 - 2013-11-25 - Sasocrest -

14/45

Why Multiplicities as Constraints?

More precise, can't we just use **types**? (cf. Slide 29)

- $\mu = 0..1, \mu = 1$:
 many programming language have direct correspondences (the first corresponds to type pointer, the second to type reference) — this is why we excluded them.
- $\mu = *$:
 could be represented by a set data-structure type without fixed bounds — no problem with our approach, we have $\mu_{\text{OCL}} = \text{true}$ anyway.
- $\mu = 0..4$:
 use array of size 4 — if model behaviour (or the implementation) adds 5th identity, we'll get a runtime error, and thereby see that the constraint is violated. **Principally acceptable**, but: checks for array bounds everywhere...?
- $\mu = 5..7$:
 could be represented by an array of size 7 — but: few programming languages/data structure libraries allow lower bounds for arrays (other than 0). If we have 5 identities and the model behaviour removes one, this should be a violation of the constraints imposed by the **model**.
 The implementation which does this removal is **wrong**. How do we see this...?

-09 - 2013-11-25 - Sasocrest -

15/45

Multiplicities Never as Types...?

Well, if the **target platform** is known and fixed, and the target platform has, for instance,

- reference types,
- range-checked arrays with positions $0, \dots, N$,
- set types,

then we could simply **restrict** the syntax of multiplicities to

$$\mu ::= 1 \mid 0..N \mid *$$

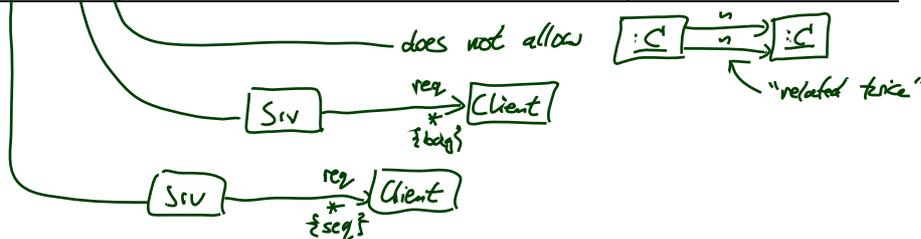

and don't think about constraints
(but use the obvious 1-to-1 mapping to types)...

In general, **unfortunately**, we don't know.

Properties

We don't want to cover association **properties** in detail, only some observations (assume binary associations):

Property	Intuition	Semantical Effect
unique	one object has at most one r -link to a single other object	current setting
bag	one object may have multiple r -links to a single other object	have $\lambda(r)$ yield multi-sets
ordered, sequence	an r -link is a sequence of object identities (possibly including duplicates)	have $\lambda(r)$ yield sequences

Properties

We don't want to cover association **properties** in detail, only some observations (assume binary associations):

Property	Intuition	Semantical Effect
unique	one object has at most one r -link to a single other object	current setting
bag	one object may have multiple r -links to a single other object	have $\lambda(r)$ yield multi-sets
ordered, sequence	an r -link is a sequence of object identities (possibly including duplicates)	have $\lambda(r)$ yield sequences

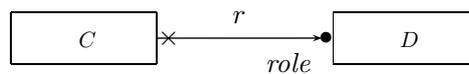

Property	OCL Typing of expression $role(expr)$
unique	$\tau_D \rightarrow Set(\tau_C)$
bag	$\tau_D \rightarrow Bag(\tau_C)$
ordered, sequence	$\tau_D \rightarrow Seq(\tau_C)$

For **subsets**, **redefines**, **union**, etc. see [OMG, 2007a, 127].

17/45

- 09 - 2013-11-25 - Sasocrest -

Ownership

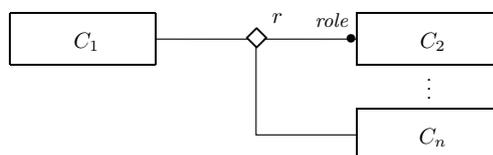

Intuitively it says:

Association r is **not a "thing on its own"** (i.e. provided by λ), but association end ' $role$ ' is **owned** by C (!). (That is, it's stored inside C object and provided by σ).

So: if multiplicity of $role$ is 0..1 or 1, then the picture above is very close to concepts of pointers/references.

Actually, ownership is seldom seen in UML diagrams. Again: if target platform is clear, one may well live without (cf. [OMG, 2007b, 42] for more details).

Not clear to me:

18/45

- 09 - 2013-11-25 - Sasocrest -

Back to the Main Track

Back to the main track:

Recall: on some earlier slides we said, the extension of the signature is **only** to study associations in “full beauty”.

For the remainder of the course, we should look for something simpler...

Proposal:

- **from now on**, we only use associations of the form

(And we may omit the non-navigability and ownership symbols.)

- Form (i) introduces $role : C_{0,1}$, and form (ii) introduces $role : C_*$ in V .
- In both cases, $role \in atr(C)$.
- We drop λ and go back to our nice σ with $\sigma(u)(role) \subseteq \mathcal{D}(D)$.

OCL Constraints in (Class) Diagrams

Where Shall We Put OCL Constraints?

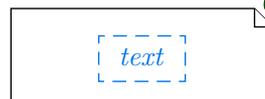

Two options:

(0) *additional documents*

- (i) Notes.
- (ii) Particular dedicated places.

(i) **Notes:**

A UML **note** is a picture of the form

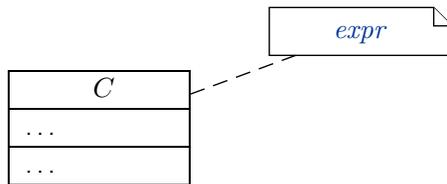

*Eselohr
(dog's ear)*

text can principally be **everything**, in particular **comments** and **constraints**.

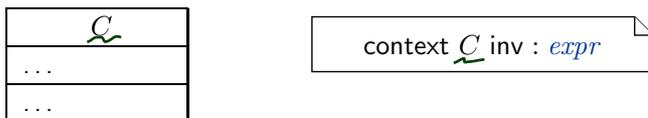

Sometimes, content is **explicitly classified** for clarity:

OCL in Notes: Conventions

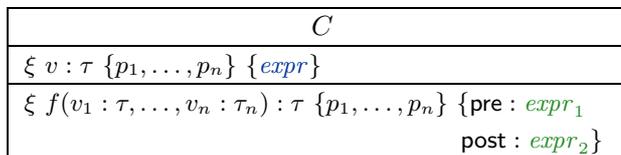

stands for

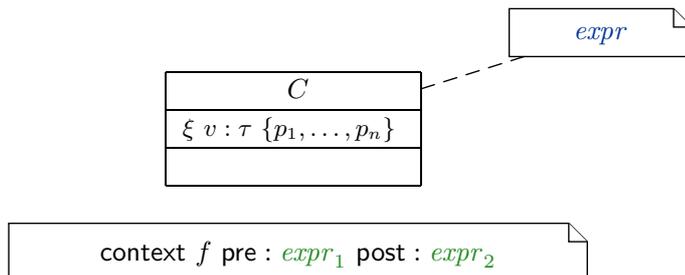

Where Shall We Put OCL Constraints?

(ii) **Particular dedicated places** in class diagrams: (behav. feature: later)

For simplicity, we view the above as an abbreviation for

Invariants of a Class Diagram

- Let \mathcal{CD} be a class diagram.
- As we (now) are able to recognise OCL constraints when we see them, we can define

$$Inv(\mathcal{CD})$$

as the set $\{\varphi_1, \dots, \varphi_n\}$ of OCL constraints **occurring** in notes in \mathcal{CD} — after **unfolding** all abbreviations (cf. next slides).

- As usual: $Inv(\mathcal{CD}) := \bigcup_{\mathcal{CD} \in \mathcal{CD}} Inv(\mathcal{CD})$.
- **Principally clear:** $Inv(\cdot)$ for any kind of diagram.

Invariant in Class Diagram Example

C
$v : \tau \{v > 3\}$

If \mathcal{CD} consists of only \mathcal{CD} with the single class C , then

- $Inv(\mathcal{CD}) = Inv(\mathcal{CD}) =$

Semantics of a Class Diagram

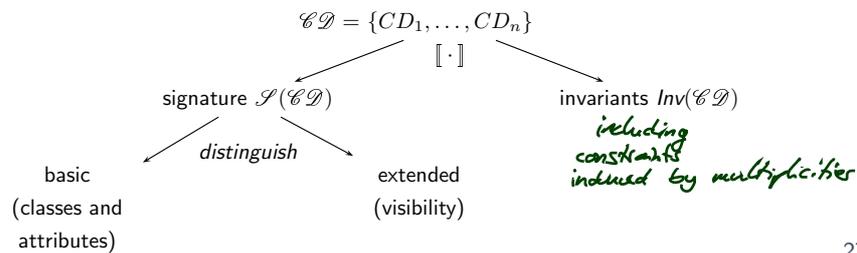

Definition. Let \mathcal{CD} be a set of class diagrams.

We say, the **semantics** of \mathcal{CD} is the signature it induces and the set of OCL constraints occurring in \mathcal{CD} , denoted

$$\llbracket \mathcal{CD} \rrbracket := \langle \mathcal{S}(\mathcal{CD}), \text{Inv}(\mathcal{CD}) \rangle.$$

Given a structure \mathcal{D} of \mathcal{S} (and thus of \mathcal{CD}), the class diagrams **describe** the system states $\Sigma_{\mathcal{D}}$, of which **some** may satisfy $\text{Inv}(\mathcal{CD})$.

In pictures:
