Live Sequence Charts — Semantics

TBA-based Semantics of LSCs

Plan:

(i) Given an LSC \mathcal{L} with body

$$((L, \preceq, \sim), \mathcal{I}, \text{Msg}, \text{Cond}, \text{LocInv}, \Theta),$$

(ii) construct a TBA $\mathcal{B}_{\mathcal{L}}$, and

(iii) define language $\mathcal{L}(\mathcal{L})$ of \mathcal{L} **in terms of** $\mathcal{L}(\mathcal{B}_{\mathcal{L}})$,

in particular taking activation condition and activation mode into account.

(iv) define language $\mathcal{L}(\mathcal{M})$ of a UML model.

• Then $\mathcal{M} \models \mathcal{L}$ (**universal**) if and only if $\mathcal{L}(\mathcal{M}) \subseteq \mathcal{L}(\mathcal{L})$.

And $\mathcal{M} \models \mathcal{L}$ (**existential**) if and only if $\mathcal{L}(\mathcal{M}) \cap \mathcal{L}(\mathcal{L}) \neq \emptyset$.

Live Sequence Charts — TBA Construction

Formal LSC Semantics: It's in the Cuts!

Definition.

Let $((L, \preceq, \sim), \mathcal{I}, \text{Msg}, \text{Cond}, \text{LocInv}, \Theta)$ be an LSC body.

A non-empty set $\emptyset \neq C \subseteq L$ is called a **cut** of the LSC body iff

- it is **downward closed**, i.e. $\forall l, l' \bullet l' \in C \wedge l \preceq l' \implies l \in C$,
- it is **closed** under **simultaneity**, i.e.

$$\forall l, l' \bullet l' \in C \wedge l \sim l' \implies l \in C, \text{ and}$$

- it comprises at least **one location per instance line**, i.e.

$$\forall i \in I \exists l \in C \bullet i_l = i.$$

The **temperature function** is extended to cuts as follows:

$$\Theta(C) = \begin{cases} \text{hot} & , \text{ if } \exists l \in C \bullet (\nexists l' \in C \bullet l \prec l') \wedge \Theta(l) = \text{hot} \\ \text{cold} & , \text{ otherwise} \end{cases}$$

that is, C is **hot** if and only if at least one of its maximal elements is hot.

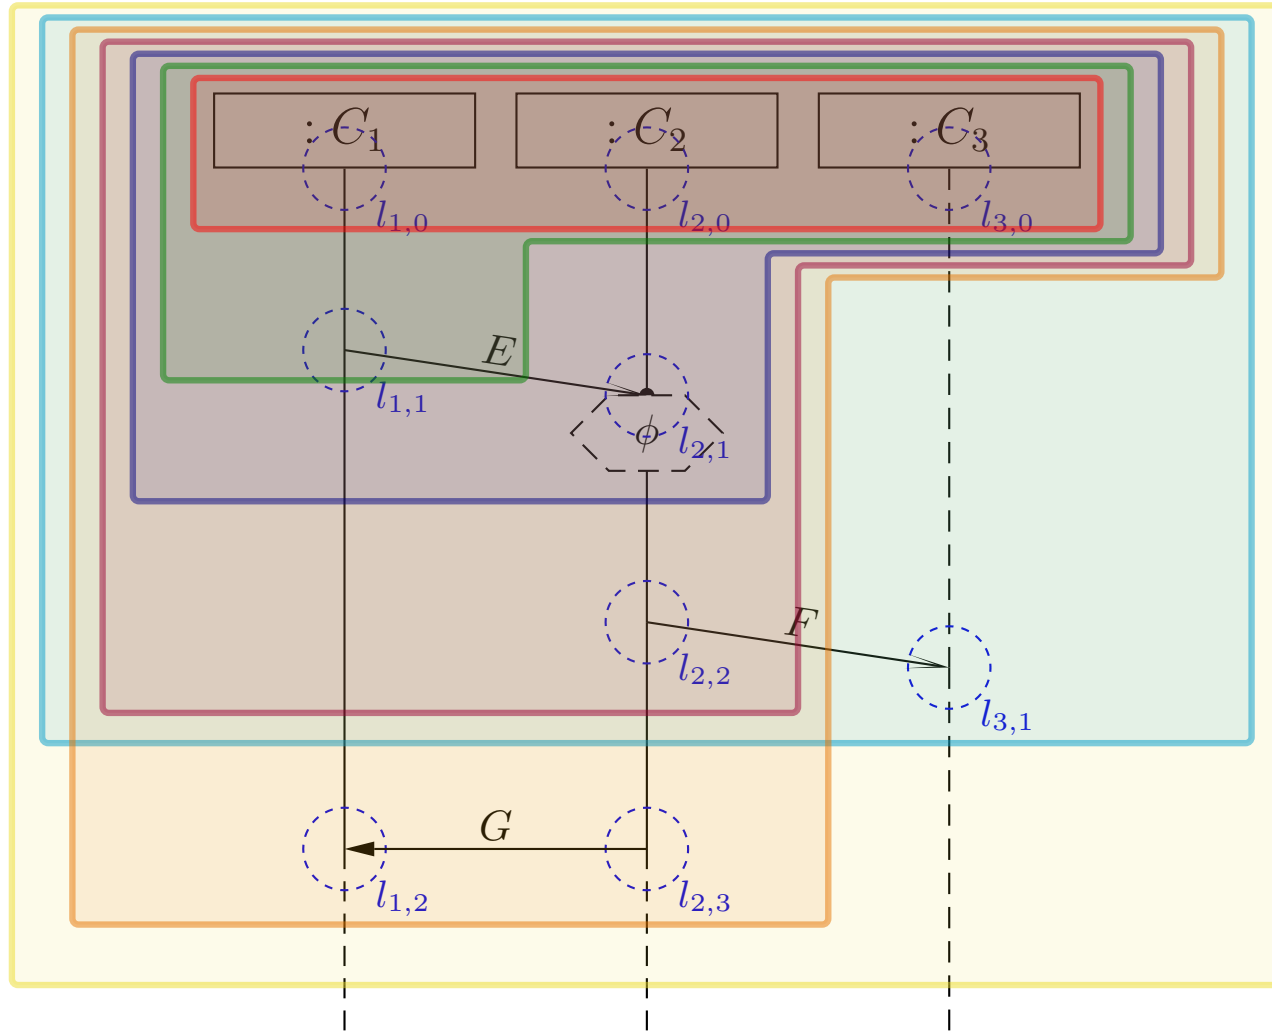

Cut Examples

① $\emptyset \neq C \subseteq L$ – downward closed – simultaneity closed – at least one loc. per instance line

Cut Examples

$\emptyset \neq C \subseteq L$ – downward closed – simultaneity closed – at least one loc. per instance line

A Successor Relation on Cuts

The partial order “ \preceq ” and the simultaneity relation “ \sim ” of locations induce a **direct successor relation** on cuts of an LSC body as follows:

Definition.

Let $C \subseteq L$ be a cut of LSC body $((L, \preceq, \sim), \mathcal{I}, \text{Msg}, \text{Cond}, \text{LocInv}, \Theta)$.

A set $\emptyset \neq F \subseteq L$ of locations is called **fire-set** F of cut C if and only if

- $C \cap F = \emptyset$ and $C \cup F$ is a cut, i.e. F is closed under simultaneity,
- all locations in F are **direct \prec -successors** of the front of C , i.e.

$$\forall l \in F \exists l' \in C \bullet l' \prec l \wedge (\nexists l'' \in C \bullet l' \prec l'' \prec l),$$

- locations in F , that lie on the same instance line, are **pairwise unordered**, i.e.

$$\forall l \neq l' \in F \bullet (\exists I \in \mathcal{I} \bullet \{l, l'\} \subseteq I) \implies l \not\prec l' \wedge l' \not\prec l,$$

- for each asynchronous (!) message reception in F , the corresponding **sending is already in C** ,

$$\forall (l, E, l') \in \text{Msg} \bullet l' \in F \implies l \in C.$$

The cut $C' = C \cup F$ is called **direct successor of C via F** , denoted by $C \rightsquigarrow_F C'$.

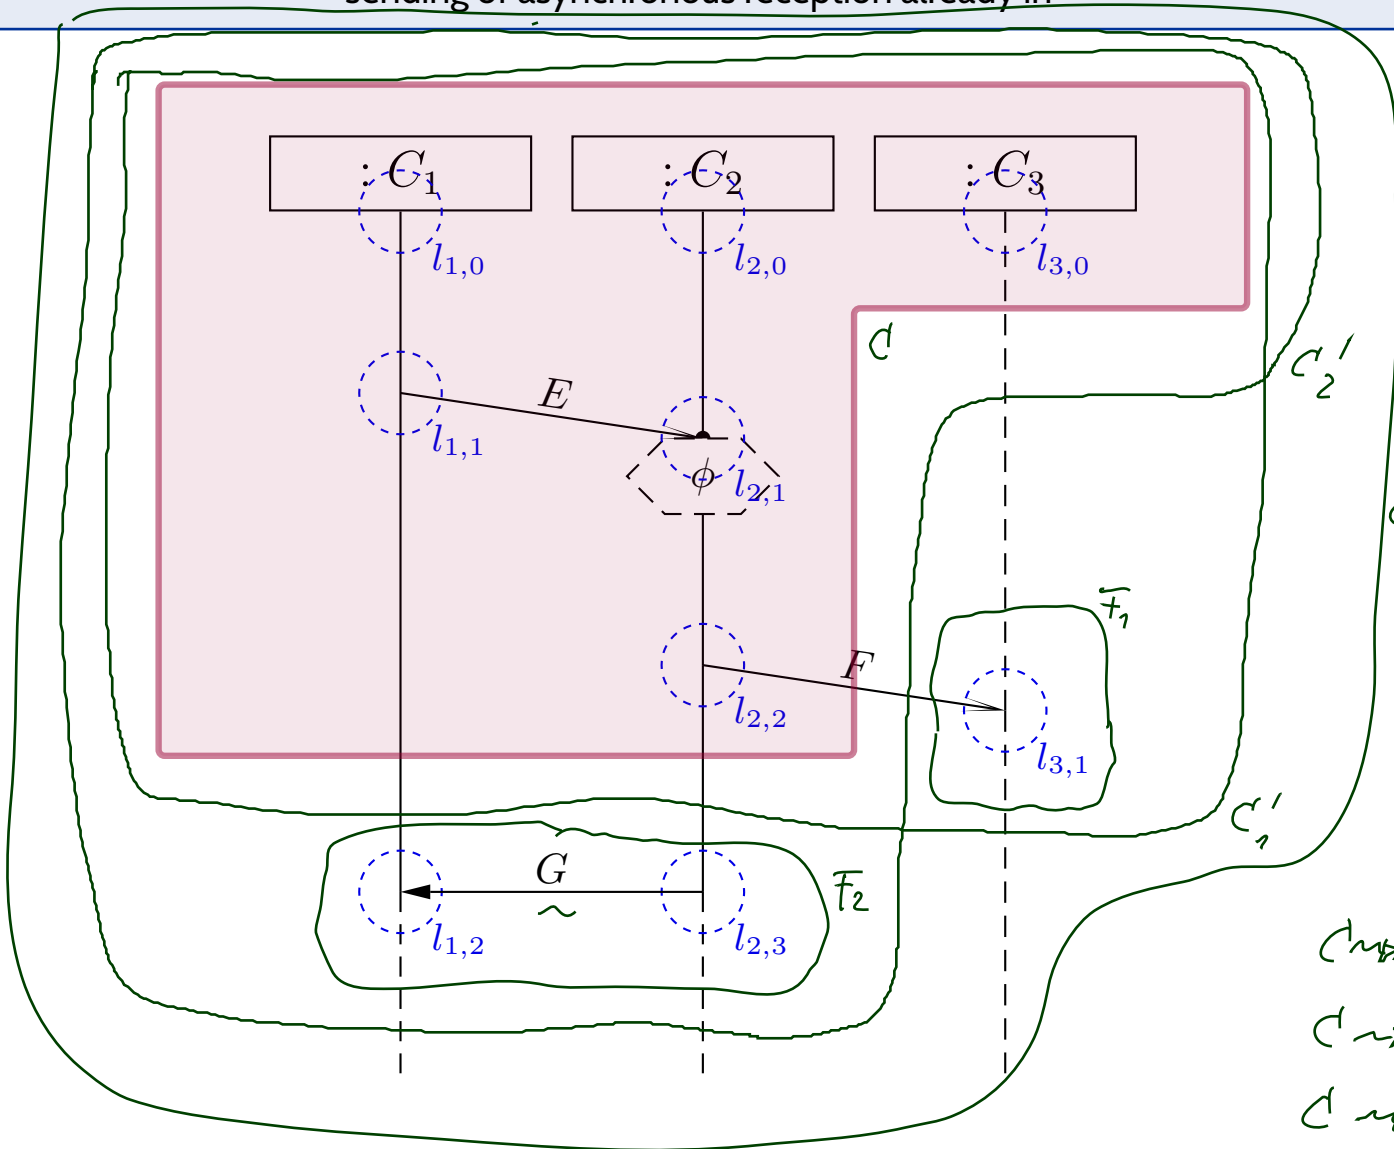

Successor Cut Example

$C \cap F = \emptyset$ - $C \cup F$ is a cut - only direct \prec -successors - same instance line on front pairwise unordered - sending of asynchronous reception already in (*)

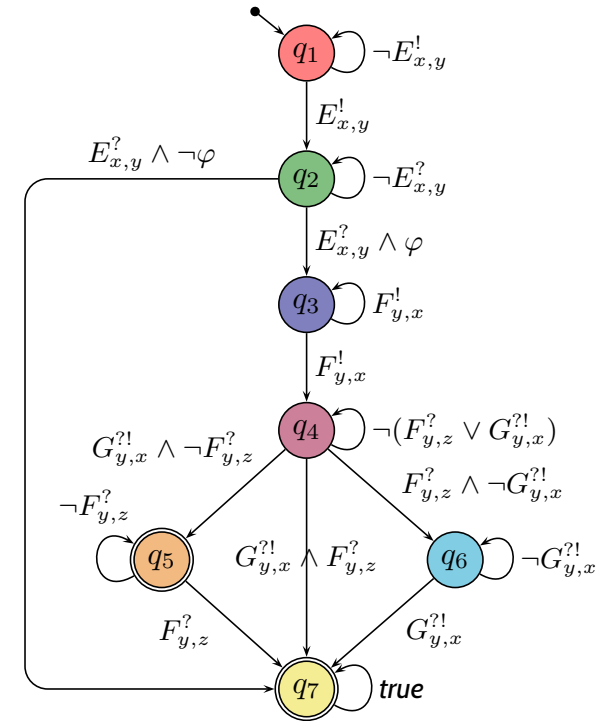

Successor Cut Example

$C \cap F = \emptyset$ - $C \cup F$ is a cut - only direct \prec -successors - same instance line on front pairwise unordered - sending of asynchronous reception already in

$C \rightarrow_{F_2} C'_1$
 $C \rightarrow_{F_2} C'_2$
 $C \rightarrow_{F_2 \cup F_2} C'_3$

Language of LSC Body: Example

The TBA $\mathcal{B}_{\mathcal{L}}$ of LSC \mathcal{L} over Φ and \mathcal{A} is $(Expr_{\mathcal{B}}(X), X, Q, q_{ini}, \rightarrow, Q_F)$ with

- Q is the set of cuts of \mathcal{L} , q_{ini} is the instance heads cut,
- $Expr_{\mathcal{B}}(X) = Expr_{\mathcal{S}}(\mathcal{E}, X)$ (for considered signature \mathcal{S}),
- \rightarrow consists of loops, progress transitions (by \rightsquigarrow_F), and legal exits (cold cond./local inv.),
- $Q_F = \{C \in Q \mid \Theta(C) = \text{cold} \vee C = L\}$ is the set of cold cuts and the maximal cut.

Signal and Attribute Expressions

- Let $\mathcal{S} = (\mathcal{I}, \mathcal{C}, V, atr, \mathcal{E})$ be a signature and X a set of logical variables,
- The signal and attribute expressions $Expr_{\mathcal{S}}(\mathcal{E}, X)$ are defined by the grammar:

$$\psi ::= true \mid \boxed{\psi} \mid E_{x,y}^! \mid E_{x,y}^? \mid \neg\psi \mid \psi_1 \vee \psi_2 \mid expr,$$

where $expr : Bool \in \underline{Expr}_{\mathcal{S}}, E \in \mathcal{E}, x, y \in X$ (or keyword *env*).

- We use

$$\mathcal{E}_{!?}(X) := \{E_{x,y}^!, E_{x,y}^? \mid E \in \mathcal{E}, x, y \in X\}$$

to denote the set of **event expressions** over \mathcal{E} and X .

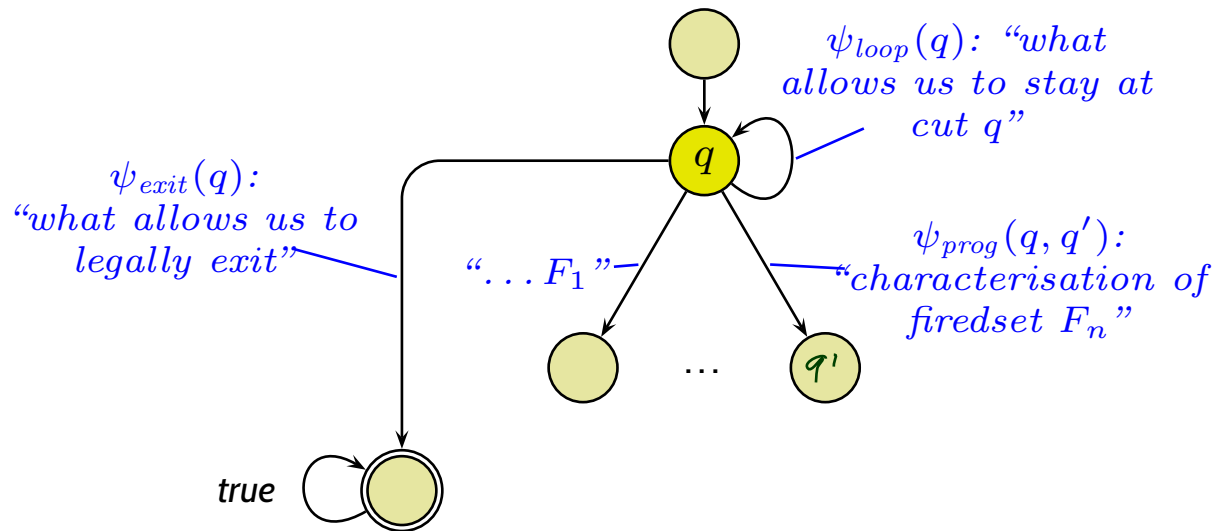

TBA Construction Principle

Recall: The TBA $\mathcal{B}(\mathcal{L})$ of LSC \mathcal{L} is $(Expr_{\mathcal{B}}(X), X, Q, q_{ini}, \rightarrow, Q_F)$ with

- Q is the **set of cuts** of \mathcal{L} , q_{ini} is the **instance heads** cut,
- $Expr_{\mathcal{B}} = \Phi \dot{\cup} \mathcal{E}_{!?}(X)$,
- \rightarrow consists of **loops**, **progress transitions** (from \rightsquigarrow_F), and **legal exits** (cold cond./local inv.),
- $F = \{C \in Q \mid \Theta(C) = \text{cold} \vee C = L\}$ is the set of cold cuts.

So in the following, we “only” need to construct the transitions’ labels:

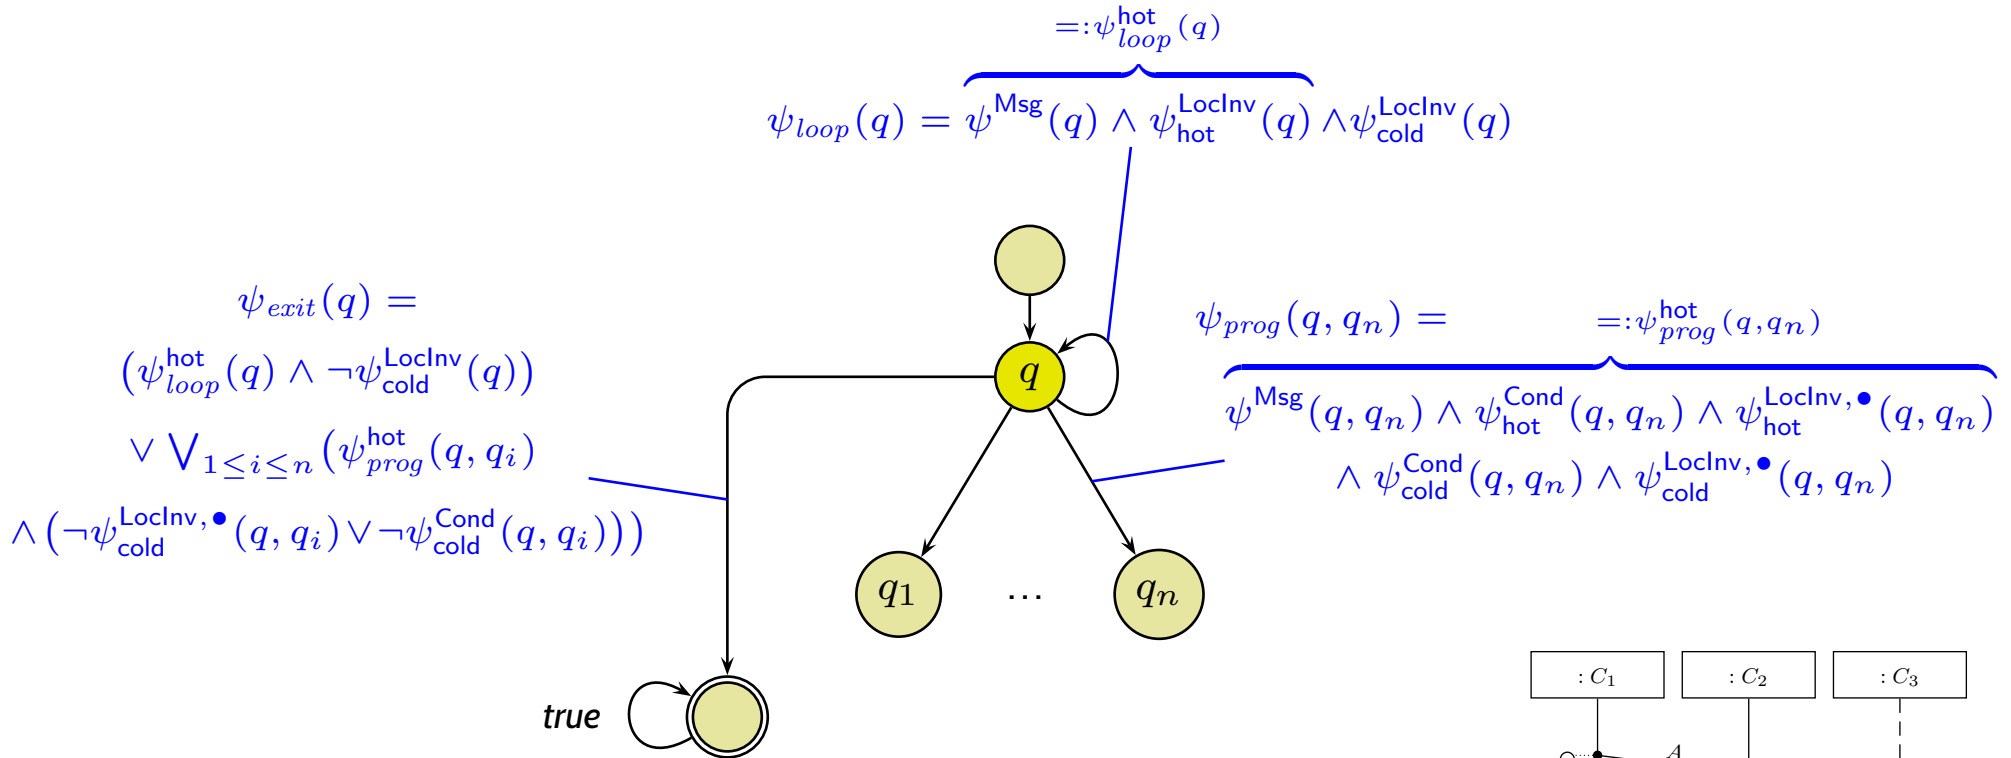

$$\rightarrow = \{(q, \psi_{loop}(q), q) \mid q \in Q\} \cup \{(q, \psi_{prog}(q, q'), q') \mid q \rightsquigarrow_F q'\} \cup \{(q, \psi_{exit}(q), L) \mid q \in Q\}$$

TBA Construction Principle

“Only” construct the transitions’ labels:

$$\rightarrow = \{(q, \psi_{loop}(q), q) \mid q \in Q\} \cup \{(q, \psi_{prog}(q, q'), q') \mid q \rightsquigarrow_F q'\} \cup \{(q, \psi_{exit}(q), L) \mid q \in Q\}$$

Loop Condition

$$\psi_{loop}(q) = \psi^{Msg}(q) \wedge \psi_{hot}^{LocInv}(q) \wedge \psi_{cold}^{LocInv}(q)$$

- $$\psi^{Msg}(q) = \neg \bigvee_{1 \leq i \leq n} \psi^{Msg}(q, q_i) \wedge \underbrace{\left(strict \implies \bigwedge_{\psi \in Msg(L)} \neg \psi \right)}_{=: \psi_{strict}(q)}$$

- $$\psi_{\theta}^{LocInv}(q) = \bigwedge_{\ell=(l, \iota, \phi, l', \iota') \in LocInv, \Theta(\ell)=\theta, \ell \text{ active at } q} \phi$$

A location l is called **front location** of cut C if and only if $\nexists l' \in L \bullet l \prec l'$.

Local invariant $(l_0, \iota_0, \phi, l_1, \iota_1)$ is **active** at cut (!) q

if and only if $l_0 \preceq l \prec l_1$ for some front location l of cut q (or $l_1 \in q \wedge \iota_1 \equiv \bullet$.)

- $$Msg(F) = \{E_{x_l, x_{l'}}^! \mid (l, E, l') \in Msg, l \in F\} \cup \{E_{x_l, x_{l'}}^? \mid (l, E, l') \in Msg, l' \in F\}$$

- $x_l \in X$ is the logical variable associated with the instance line I which includes l , i.e. $l \in I$.

- $$Msg(F_1, \dots, F_n) = \bigcup_{1 \leq i \leq n} Msg(F_i)$$

Progress Condition

$$\psi_{prog}^{hot}(q, q_i) = \psi^{Msg}(q, q_n) \wedge \psi_{hot}^{Cond}(q, q_n) \wedge \psi_{hot}^{LocInv, \bullet}(q_n)$$

- $$\psi^{Msg}(q, q_i) = \bigwedge_{\psi \in \text{Msg}(q_i \setminus q)} \psi \wedge \bigwedge_{j \neq i} \bigwedge_{\psi \in \text{Msg}(q_j \setminus q) \setminus \text{Msg}(q_i \setminus q)} \neg \psi$$

$$\wedge \underbrace{\left(\text{strict} \implies \bigwedge_{\psi \in \text{Msg}(L) \setminus \text{Msg}(F_i)} \neg \psi \right)}_{=:\psi_{strict}(q, q_i)}$$
- $$\psi_{\theta}^{Cond}(q, q_i) = \bigwedge_{\gamma=(L, \phi) \in \text{Cond}, \Theta(\gamma)=\theta, L \cap \underbrace{(q_i \setminus q)}_{\text{fired-set}} \neq \emptyset} \phi$$
- $$\psi_{\theta}^{LocInv, \bullet}(q, q_i) = \bigwedge_{\lambda=(l, \iota, \phi, l', \iota') \in \text{LocInv}, \Theta(\lambda)=\theta, \lambda \bullet\text{-active at } q_i} \phi$$

Local invariant $(l_0, \iota_0, \phi, l_1, \iota_1)$ is **•-active** at q if and only if

- $l_0 \prec l \prec l_1$, or
- $l = l_0 \wedge \iota_0 = \bullet$, or
- $l = l_1 \wedge \iota_1 = \bullet$

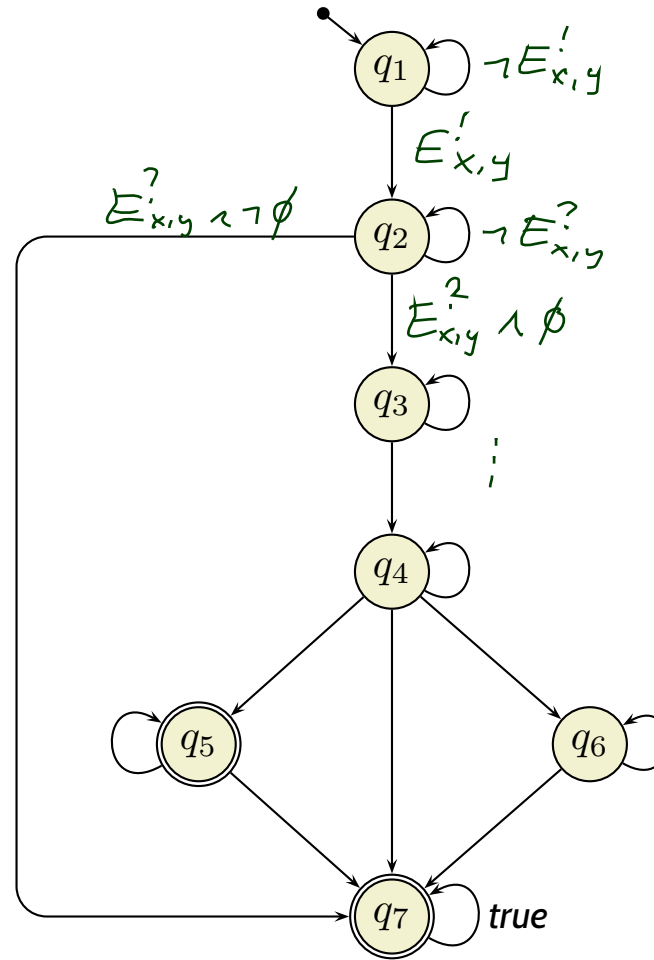

for some front location l of cut (!) q .

Example

Using logical variables x, y, z for the instances lines (from left to right).

Course Map

Excursion: Büchi Automata

From Finite Automata to Symbolic Büchi Automata

$L_{\text{lang}}(\mathcal{A}) = 0 \cdot (1 \cdot 0)^*$

Büchi
infinite words

$\omega = 01010101\dots$

$L_{\text{lang}}(\mathcal{B}) = (0 \cdot 1)^\omega$

symbolic

symbolic

Büchi
infinite words

Definition. A **Symbolic Büchi Automaton** (TBA) is a tuple

$$\mathcal{B} = (\text{Expr}_{\mathcal{B}}(X), X, Q, q_{ini}, \rightarrow, Q_F)$$

where

- X is a set of logical variables,
- $\text{Expr}_{\mathcal{B}}(X)$ is a set of Boolean expressions over X ,
- Q is a finite set of **states**,
- $q_{ini} \in Q$ is the initial state,
- $\rightarrow \subseteq Q \times \text{Expr}_{\mathcal{B}}(X) \times Q$ is the **transition relation**. Transitions (q, ψ, q') from q to q' are labelled with an expression $\psi \in \text{Expr}_{\mathcal{B}}(X)$.
- $Q_F \subseteq Q$ is the set of **fair** (or accepting) states.

Definition. Let X be a set of logical variables and let $Expr_{\mathcal{B}}(X)$ be a set of Boolean expressions over X .

A set $(\Sigma, \cdot \models \cdot)$ is called an **alphabet** for $Expr_{\mathcal{B}}(X)$ if and only if

- for each $\sigma \in \Sigma$,
- for each expression $expr \in Expr_{\mathcal{B}}$, and
- for each valuation $\beta : X \rightarrow \mathcal{D}(X)$ of logical variables,

either $\sigma \models_{\beta} expr$ **or** $\sigma \not\models_{\beta} expr$.

(σ **satisfies** (or does not satisfy) $expr$ under valuation β)

An **infinite sequence**

$$w = (\sigma_i)_{i \in \mathbb{N}_0} \in \Sigma^{\omega}$$

over $(\Sigma, \cdot \models \cdot)$ is called **word** (for $Expr_{\mathcal{B}}(X)$).

Run of TBA over Word

Definition. Let $\mathcal{B} = (\text{Expr}_{\mathcal{B}}(X), X, Q, q_{ini}, \rightarrow, Q_F)$ be a TBA and

$$w = \sigma_1, \sigma_2, \sigma_3, \dots$$

a word for $\text{Expr}_{\mathcal{B}}(X)$. An infinite sequence

$$\varrho = q_0, q_1, q_2, \dots \in Q^\omega$$

is called **run of \mathcal{B} over w** under valuation $\beta : X \rightarrow \mathcal{D}(X)$ if and only if

- $q_0 = q_{ini}$,
- for each $i \in \mathbb{N}_0$ there is a transition

$$(q_i, \psi_i, q_{i+1}) \in \rightarrow$$

such that $\sigma_i \models_{\beta} \psi_i$.

Example:

The Language of a TBA

Definition.

We say TBA $\mathcal{B} = (\text{Expr}_{\mathcal{B}}(X), X, Q, q_{ini}, \rightarrow, Q_F)$ **accepts** the word

$$w = (\sigma_i)_{i \in \mathbb{N}_0} \in (\text{Expr}_{\mathcal{B}} \rightarrow \mathbb{B})^\omega$$

if and only if \mathcal{B} **has** a run

$$\varrho = (q_i)_{i \in \mathbb{N}_0}$$

over w such that fair (or accepting) states are **visited infinitely often** by ϱ , i.e., such that

$$\forall i \in \mathbb{N}_0 \exists j > i : q_j \in Q_F.$$

We call the set $\mathcal{L}(\mathcal{B}) \subseteq (\text{Expr}_{\mathcal{B}} \rightarrow \mathbb{B})^\omega$ of words that are accepted by \mathcal{B} the **language of \mathcal{B}** .
