The Logic of Uppaal

Uppaal Fragment of Timed Computation Tree Logic

Consider $\mathcal{N} = \mathcal{C}(\mathcal{A}_1, \dots, \mathcal{A}_n)$ over data variables V .

- **basic formula:**

$$atom ::= \mathcal{A}_i.l \mid \varphi$$

where $l \in L_i$ is a location and φ a constraint over X_i and V .

- **configuration formulae:**

$$term ::= atom \mid \neg term \mid term_1 \wedge term_2$$

- **existential path formulae:** (“exists finally”, “exists globally”)

$$e\text{-formula} ::= \exists \diamond term \mid \exists \square term$$

- **universal path formulae:** (“always finally”, “always globally”, “leads to”)

$$a\text{-formula} ::= \forall \diamond term \mid \forall \square term \mid term_1 \longrightarrow term_2$$

- **formulae:**

$$F ::= e\text{-formula} \mid a\text{-formula}$$

Configurations at Time t

- Recall: **computation path** (or path) **starting in** $\langle \vec{\ell}_0, \nu_0 \rangle, t_0$:

$$\xi = \langle \vec{\ell}_0, \nu_0 \rangle, t_0 \xrightarrow{\lambda_1} \langle \vec{\ell}_1, \nu_1 \rangle, t_1 \xrightarrow{\lambda_2} \langle \vec{\ell}_2, \nu_2 \rangle, t_2 \xrightarrow{\lambda_3} \dots$$

which is **infinite or maximally finite**.

- Given ξ and $t \in \text{Time}$, we use $\xi(t)$ to denote the set

$$\{\langle \vec{\ell}, \nu \rangle \mid \exists i \in \mathbb{N}_0 : t_i \leq t \leq t_{i+1} \wedge \vec{\ell} = \vec{\ell}_i \wedge \nu = \nu_i + t - t_i\}.$$

of **configurations at time** t .

- Why is it a set?
- Can it be empty?

Example

$$\begin{aligned}
 \xi &= \langle \mathbf{off}, x = 0 \rangle, 0 \xrightarrow{4.2} \langle \mathbf{off}, x = 4.2 \rangle, 4.2 \xrightarrow{\text{press?}} \langle \mathbf{light}, x = 0 \rangle, 4.2 \\
 &\xrightarrow{2.1} \langle \mathbf{light}, x = 2.1 \rangle, 6.3 \xrightarrow{\text{press?}} \langle \mathbf{bright}, x = 2.1 \rangle, 6.3 \\
 &\xrightarrow{10} \langle \mathbf{bright}, x = 12.1 \rangle, 16.3 \xrightarrow{\text{press?}} \langle \mathbf{off}, x = 12.1 \rangle, 16.3 \\
 &\xrightarrow{\text{press?}} \langle \mathbf{light}, x = 0 \rangle, 16.3 \xrightarrow{0} \langle \mathbf{light}, x = 0 \rangle, 16.3
 \end{aligned}$$

$$\xi(t) = \{ \langle \vec{l}, \nu \rangle \mid \exists i \in \mathbb{N}_0 : t_i \leq t \leq t_{i+1} \wedge \vec{l} = \vec{l}_i \wedge \nu = \nu_i + t - t_i \}$$

- $\xi(0) = \{ \langle \mathbf{off}, x=0 \rangle \}$
- $\xi(0.1) = \{ \langle \mathbf{off}, x=0.1 \rangle \}$
- $\xi(4.1999) = \{ \langle \mathbf{off}, x=4.1999 \rangle \}$
- $\xi(4.2) = \{ \langle \mathbf{off}, x=4.2 \rangle, \langle \mathbf{light}, 0 \rangle \}$
- $\xi(4.2001) = \{ \langle \mathbf{light}, x=0.0001 \rangle \}$
- $\xi(16.3) = \{ \langle \mathbf{light}, x=12.1 \rangle, \dots \}$
- $\xi(27) = \{ \}$

Excursion: Computation / Transition Graph

- **Recall:** **operational semantics** of network \mathcal{N} of timed automata is a **labelled transition system**

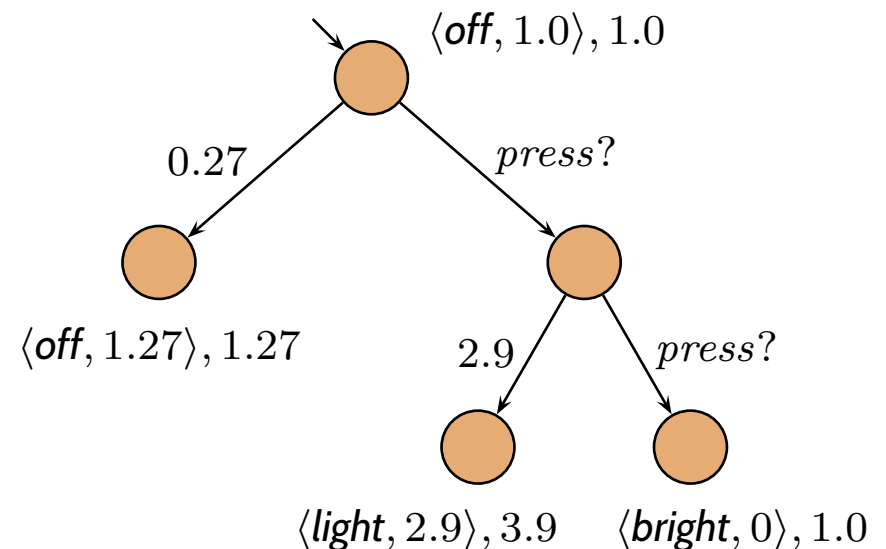

$$\mathcal{T}(\mathcal{N}) = (Conf, \text{Time} \cup \{\tau\}, \{\xrightarrow{\lambda} \mid \lambda \in \text{Time} \cup \{\tau\}\}, C_{ini}).$$

- (Parts of) $\mathcal{T}(\mathcal{N})$ can be represented as a directed, edge-labelled **graph** $(V, E, \text{Time} \cup \{\tau\})$ where

- **vertices** $V \subseteq Conf$ are (possibly time-stamped) **configurations**,
- **graph-edges** (c, λ, c') correspond to **transitions** $c \xrightarrow{\lambda} c'$.

- There may be at most one designated **start vertex** c ,
 - paths in the graph **originating** at c
 - represent transition sequences (or computation paths) of $\mathcal{T}(\mathcal{N})$ **starting in** c .

Example: Desktop Lamp.

Satisfaction of Uppaal-Logic by Configurations

- We define a **satisfaction relation**

$$\langle \vec{l}_0, \nu_0 \rangle, t_0 \models F$$

between **time stamped configurations**

$$\langle \vec{l}_0, \nu_0 \rangle, t_0$$

of a network $\mathcal{C}(\mathcal{A}_1, \dots, \mathcal{A}_i, \dots, \mathcal{A}_n)$ and **formulae** F of the Uppaal logic.

- It is defined inductively as follows (starting with **atoms** and **terms**):

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models \mathcal{A}_i.l$ iff $l_{0,i} = l$

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models \varphi$ iff $\nu_0 \models \varphi$

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models \neg term$ iff $\langle \vec{l}_0, \nu_0 \rangle, t_0 \not\models term$

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models term_1 \wedge term_2$ iff $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models term_i, i = 1, 2$

Satisfaction of Uppaal-Logic by Configurations

- We define a **satisfaction relation**

$$\langle \vec{l}_0, \nu_0 \rangle, t_0 \models F$$

between **time stamped configurations**

$$\langle \vec{l}_0, \nu_0 \rangle, t_0$$

of a network $\mathcal{C}(\mathcal{A}_1, \dots, \mathcal{A}_n)$ and **formulae** F of the Uppaal logic.

- It is defined inductively as follows (starting with **atoms** and **terms**):

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models \mathcal{A}_i.l$ iff $l_{0,i} = l$
- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models \varphi$ iff $\nu_0 \models \varphi$
- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models \neg term$ iff $\langle \vec{l}_0, \nu_0 \rangle, t_0 \not\models term$
- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models term_1 \wedge term_2$ iff $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models term_i, i = 1, 2$

Satisfaction of Uppaal-Logic by Configurations

Exists finally:

- $\langle \vec{\ell}_0, \nu_0 \rangle, t_0 \models \exists \diamond term$ iff \exists path ξ of \mathcal{N} starting in $\langle \vec{\ell}_0, \nu_0 \rangle, t_0$
 $\exists t \in \text{Time}, \langle \vec{\ell}, \nu \rangle \in \text{Conf} :$
 $t_0 \leq t \wedge \langle \vec{\ell}, \nu \rangle \in \xi(t) \wedge \langle \vec{\ell}, \nu \rangle, t \models term$

Example: $\exists \diamond \varphi$

Satisfaction of Uppaal-Logic by Configurations

Exists finally:

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models \exists \diamond term$ iff \exists path ξ of \mathcal{N} starting in $\langle \vec{l}_0, \nu_0 \rangle, t_0$
 $\exists t \in \text{Time}, \langle \vec{l}, \nu \rangle \in \text{Conf} :$
 $t_0 \leq t \wedge \langle \vec{l}, \nu \rangle \in \xi(t) \wedge \langle \vec{l}, \nu \rangle, t \models term$

Example: $\exists \diamond \varphi$

Satisfaction of Uppaal-Logic by Configurations

Exists globally:

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models \exists \square term$ iff \exists path ξ of \mathcal{N} starting in $\langle \vec{l}_0, \nu_0 \rangle, t_0$
 $\forall t \in \text{Time}, \langle \vec{l}, \nu \rangle \in \text{Conf} :$
 $t_0 \leq t \wedge \langle \vec{l}, \nu \rangle \in \xi(t) \implies \langle \vec{l}, \nu \rangle, t \models term$

Example: $\exists \square \varphi$

Satisfaction of Uppaal-Logic by Configurations

Exists globally:

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models \exists \square term$ iff \exists path ξ of \mathcal{N} starting in $\langle \vec{l}_0, \nu_0 \rangle, t_0$
 $\forall t \in \text{Time}, \langle \vec{l}, \nu \rangle \in \text{Conf} :$
 $t_0 \leq t \wedge \langle \vec{l}, \nu \rangle \in \xi(t) \implies \langle \vec{l}, \nu \rangle, t \models term$

Example: $\exists \square \varphi$

Satisfaction of Uppaal-Logic by Configurations

- **Always finally:**

- $\langle \vec{\ell}_0, \nu_0 \rangle, t_0 \models \forall \diamond term$ iff $\langle \vec{\ell}_0, \nu_0 \rangle, t_0 \not\models \exists \square \neg term$

- **Always globally:**

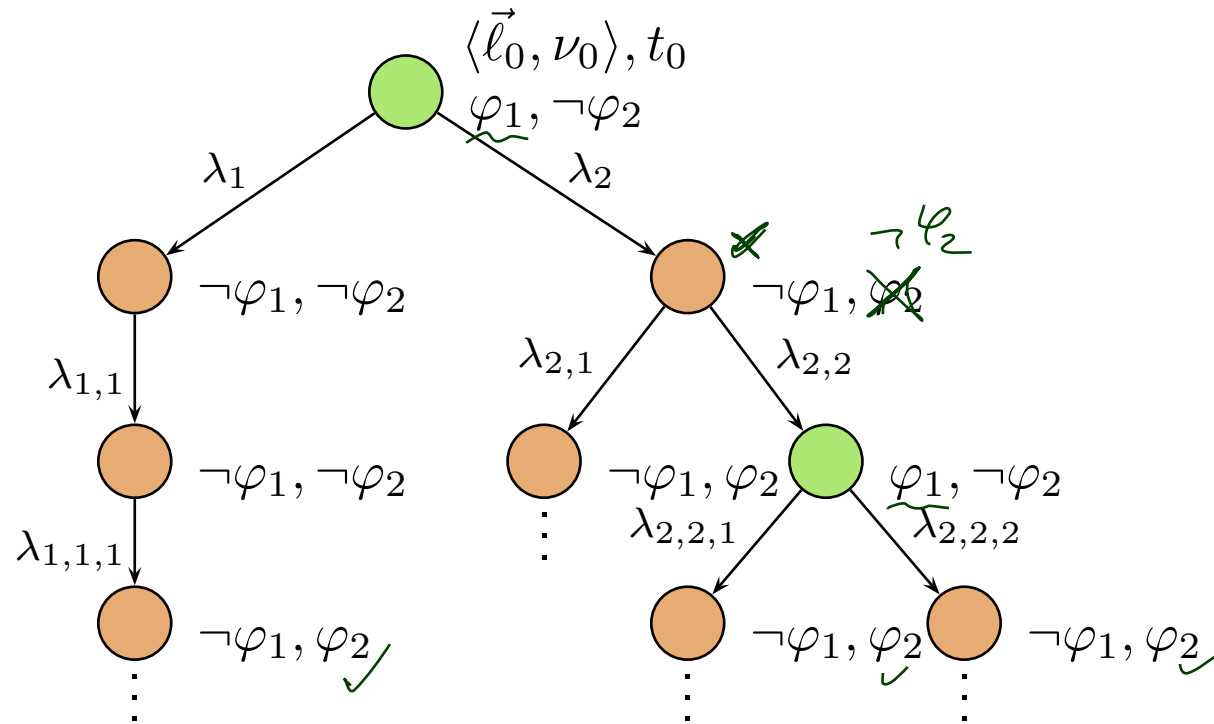

- $\langle \vec{\ell}_0, \nu_0 \rangle, t_0 \models \forall \square term$ iff $\langle \vec{\ell}_0, \nu_0 \rangle, t_0 \not\models \exists \diamond \neg term$

Satisfaction of Uppaal-Logic by Configurations

Leads to:

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models term_1 \longrightarrow term_2$ iff \forall path ξ of \mathcal{N} starting in $\langle \vec{l}_0, \nu_0 \rangle, t_0$
 $\forall t \in \text{Time}, \langle \vec{l}, \nu \rangle \in \text{Conf} :$
 $t_0 \leq t \wedge \langle \vec{l}, \nu \rangle \in \xi(t) \wedge \langle \vec{l}, \nu \rangle, t \models term_1$
 $\implies \langle \vec{l}, \nu \rangle, t \models \forall \Diamond term_2$

Example: $\varphi_1 \longrightarrow \varphi_2$

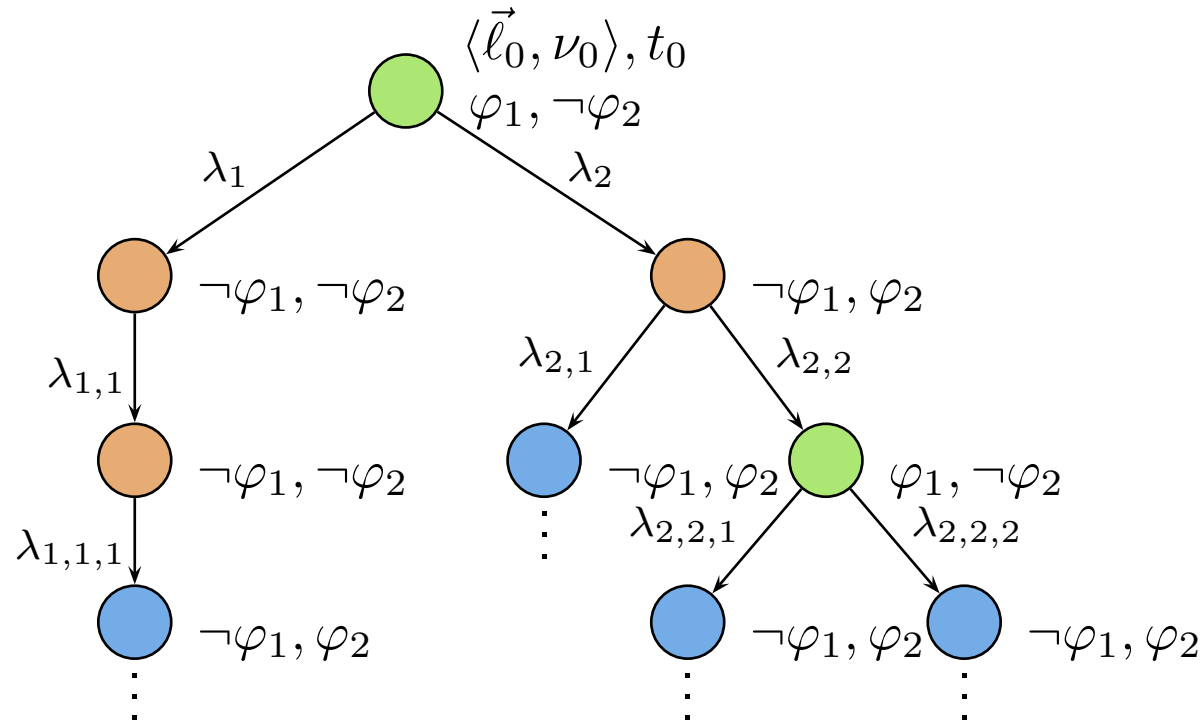

Satisfaction of Uppaal-Logic by Configurations

Leads to:

- $\langle \vec{l}_0, \nu_0 \rangle, t_0 \models term_1 \longrightarrow term_2$ iff \forall path ξ of \mathcal{N} starting in $\langle \vec{l}_0, \nu_0 \rangle, t_0$
 $\forall t \in \text{Time}, \langle \vec{l}, \nu \rangle \in \text{Conf} :$
 $t_0 \leq t \wedge \langle \vec{l}, \nu \rangle \in \xi(t) \wedge \langle \vec{l}, \nu \rangle, t \models term_1$
 $\implies \langle \vec{l}, \nu \rangle, t \models \forall \Diamond term_2$
- $(\sim \forall \Diamond (term_1 \rightarrow A \Diamond term_2))$
 "response pattern"

Example: $\varphi_1 \longrightarrow \varphi_2$

Satisfaction of Uppaal-Logic by Networks

- We write $\mathcal{N} \models e\text{-formula}$ if and only if

$$\text{for some } \langle \vec{l}_0, \nu_0 \rangle \in C_{ini}, \quad \langle \vec{l}_0, \nu_0 \rangle, 0 \models e\text{-formula}, \quad (1)$$

and $\mathcal{N} \models a\text{-formula}$ if and only if

$$\text{for all } \langle \vec{l}_0, \nu_0 \rangle \in C_{ini}, \quad \langle \vec{l}_0, \nu_0 \rangle, 0 \models a\text{-formula}, \quad (2)$$

where C_{ini} are the initial configurations of $\mathcal{T}_e(\mathcal{N})$.

- If $C_{ini} = \emptyset$, (1) is a contradiction and (2) is a tautology.
- If $C_{ini} \neq \emptyset$, then

$$\mathcal{N} \models F \text{ if and only if } \langle \vec{l}_{ini}, \nu_{ini} \rangle, 0 \models F.$$

Example

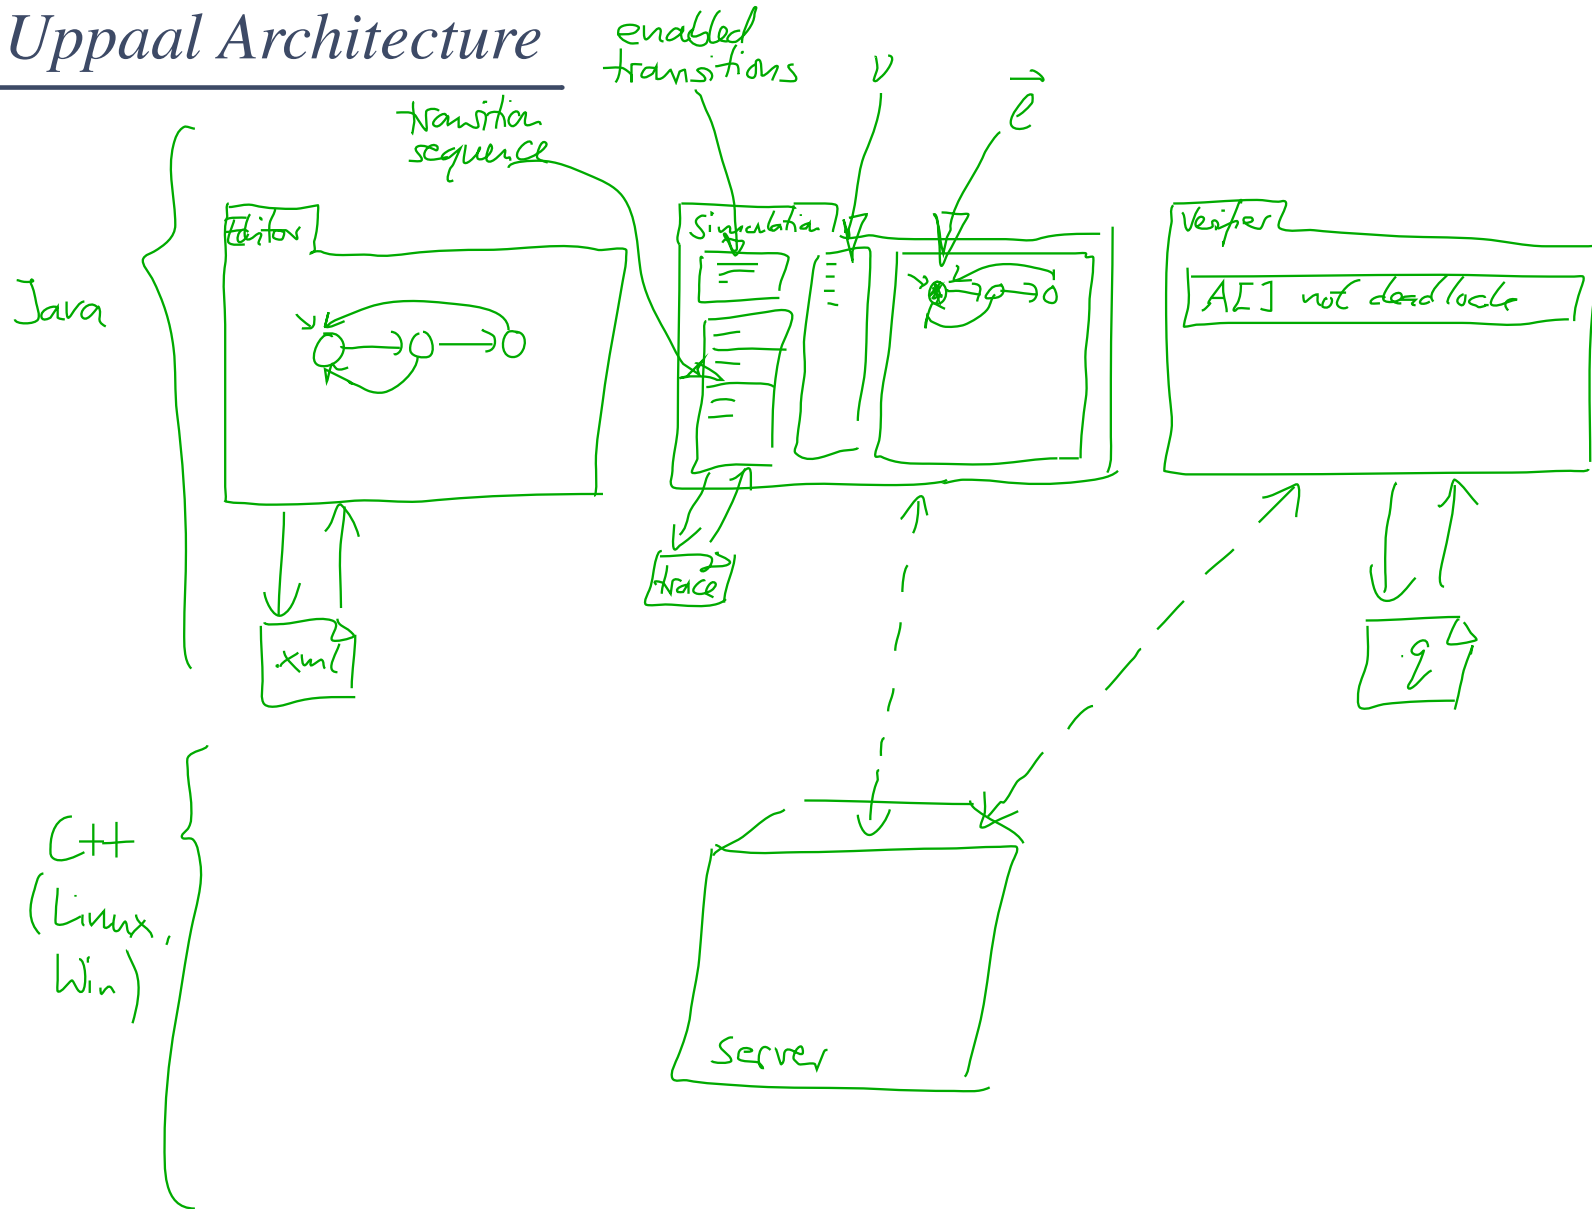

Example

- $\mathcal{N} \models \exists \diamond \mathcal{L}.bright?$ ✓
- $\mathcal{N} \models \exists \square \mathcal{L}.bright?$ ✗ (we always start in off...)
- $\mathcal{N} \models \exists \square \mathcal{L}.off?$ ✓ (stay in off forever)
- $\mathcal{N} \models \forall \diamond \mathcal{L}.light?$ ✗ —u—
- $\mathcal{N} \models \forall \square (\mathcal{L}.bright \implies x \geq 3)?$ ✗
- $\mathcal{N} \models (\mathcal{L}.bright \longrightarrow \mathcal{L}.off)?$...

for Timed Automata*

Model-Checking DC Properties with Uppaal

DC formula

$\models? F$

$I: OLS$
 $\rightarrow (\neg \text{light} \rightarrow \text{off})$

- **Question 1:** what is the “ \models ”-relation here?
- **Question 2:** what kinds of DC formulae can we check with Uppaal?
 - **Clear:** Not every DC formula.
(Otherwise contradicting undecidability results.)
 - **Quite clear:** $F = \square[\text{off}]$ or $F = \neg \diamond[\text{light}]$
(Use Uppaal’s fragment of TCTL, something like (!) $\forall \square$ off.)
 - **Maybe:** $F = \ell > 5 \implies \diamond[\text{off}]^5$
 - **Not so clear:** $F = \neg \diamond([\text{bright}] ; [\text{light}])$

Observing Timed Automata

Network of TA Satisfies DC Formula

Question 1: what is the “ \models ”-relation here?

What should it mean if we say “network \mathcal{N} satisfies DC formula F ” (written $\mathcal{N} \models F$)?

Two main options:

- Characterise the behaviour of \mathcal{N} by a DC formula $F_{\mathcal{N}}$ and set

$$\mathcal{N} \models F \quad : \text{ iff } \left(\underset{\substack{\uparrow \\ \text{DC}}}{\models F_{\mathcal{N}}} \implies \underset{\substack{\uparrow \\ \text{DC}}}{F} \right)$$

(as we have done for PLC automata).

- “Transform” each **computation paths** ξ of \mathcal{N} into an **evolution** \mathcal{I}_{ξ} and set

$$\mathcal{N} \models F \quad : \text{ iff } \quad \forall \xi \bullet \underbrace{\mathcal{I}_{\xi} \models_0 F}$$

that is, the **evolution** of each **computation path** of \mathcal{N} **realises** F from 0.

In the following, we shall discuss the **second one**.

Observables of a Network of Timed Automata

Let \mathcal{N} be a network of n extended timed automata

$$\mathcal{A}_{e,i} = (L_i, C_i, B_i, U_i, X_i, V_i, I_i, E_i, \ell_{ini,i}), \quad 1 \leq i \leq n$$

For simplicity: assume that all L_i and V_i are pairwise disjoint (otherwise rename).

Definition. The **observables** $\text{Obs}(\mathcal{N})$ of \mathcal{N} are

$$\{\ell_1, \dots, \ell_n\} \dot{\cup} \bigcup_{1 \leq i \leq n} V_i$$

with

$$\{\odot_1, \dots, \odot_n\}$$

- $\mathcal{D}(\ell_i) = L_i$,
- $\mathcal{D}(v)$ is the domain of data-variable v in $\mathcal{A}_{e,i}$.

Example

- **Observables:** $\text{Obs}(\mathcal{N}) = \{\ell_1, \ell_2\}$ with
 - $\mathcal{D}(\ell_1) = \{\text{off}, \text{light}, \text{bright}\}$, $\mathcal{D}(\ell_2) = \{\ell_0\}$. (No data variables in \mathcal{N} !)

Consider **computation path**

$$\xi = \langle \text{off}_0 \rangle, 0 \xrightarrow{2.5} \langle \text{off}_{2.5} \rangle, 2.5 \xrightarrow{\tau} \langle \text{light}_0 \rangle, 2.5 \xrightarrow{2.0} \langle \text{light}_{2.0} \rangle, 4.5 \xrightarrow{\tau} \langle \text{bright}_{2.0} \rangle, 4.5 \dots$$

and **construct interpretation** $\mathcal{I}_\xi : \text{Obs}(\mathcal{N}) \rightarrow (\text{Time} \rightarrow \mathcal{D})$:

Tell Them What You've Told Them...

- Properties **to be checked** for a timed automata model can be specified using the **Uppaal Query Language**,
 - which is a **tiny little fragment** of Timed CTL (TCTL),
 - and as such **by far** not as expressive as Duration Calculus.
 - **TCTL** is another **means** to **formalise requirements**.
-
- For **testable** DC formulae F , we can automatically verify whether a network \mathcal{N} satisfies F .
 - by constructing an **observer automaton**
 - and **transforming** \mathcal{N} appropriately.
 - There are **untestable** DC formulae.
(Everything else would be surprising.)
