Semantics for Java

The Java Language Specification (JLS) 3rd edition gives semantics for Java

- The document has 684 pages.
- 118 pages to define semantics of expression.
- 42 pages to define semantics of method invocation.

Semantics are only defined by prosa text.
How can we give the semantics formally?
Need a mathematical model for computations.

Operational Semantics for Java

Idea: define transition system for Java

Definition (Transition System)

A transition system (TS) is a structure $TS = (Q, Act, \rightarrow)$, where

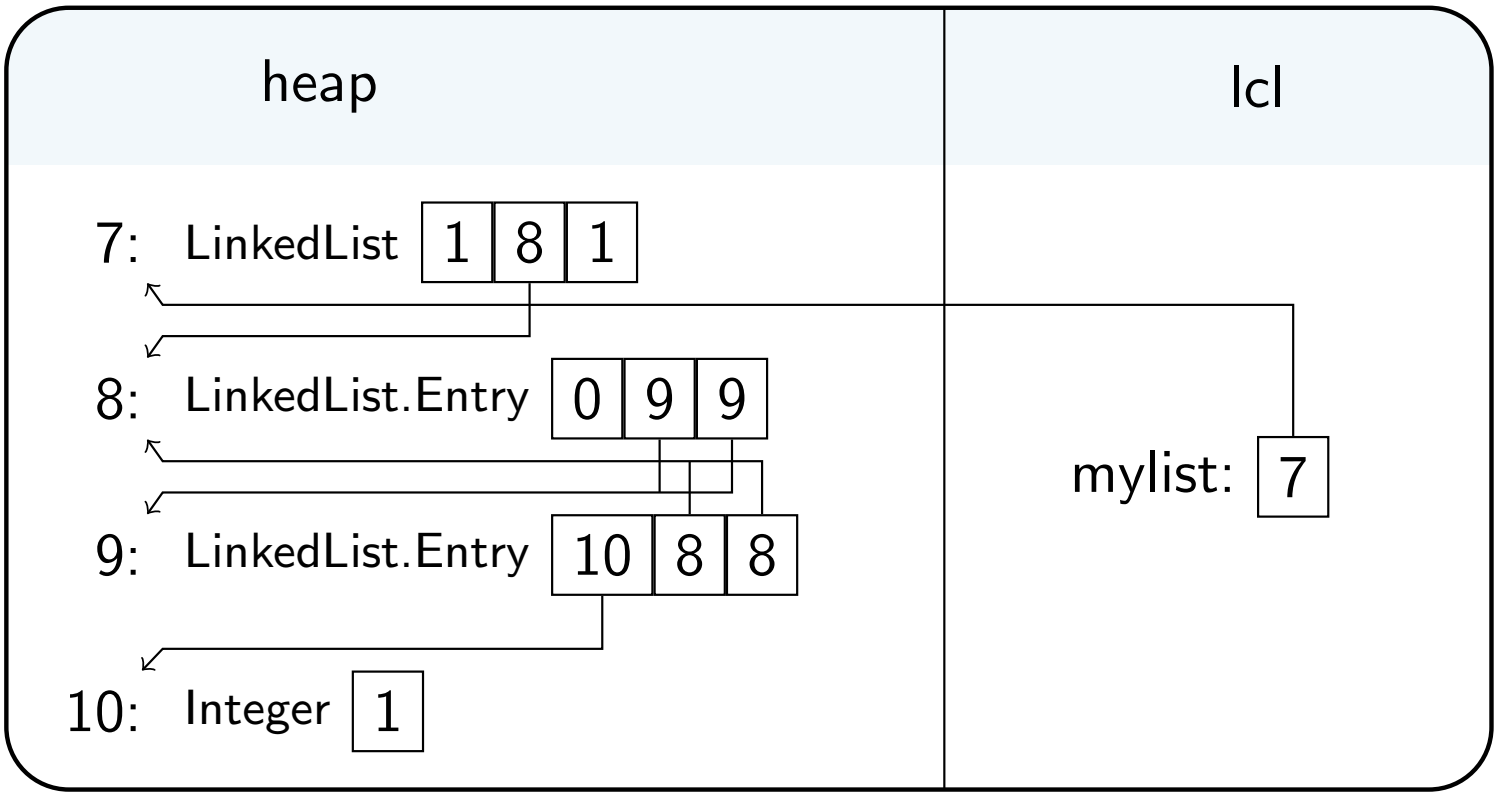
- Q is a set of states,
- Act a set of actions,
- $\rightarrow \subseteq Q \times Act \times Q$ the transition relation.

- Q reflects the current dynamic state (heap and local variables).
- Act is the executed code.
- Idea from: D. v. Oheimb, T. Nipkow, Machine-checking the Java specification: Proving type-safety, 1999

Example: State of a Java Program

What is the state after executing this code?

```
List mylist = new LinkedList();
mylist.add(new Integer(1));
```



State of a Java Program

The state of a Java program gives valuations local and global (heap) variables.

- $Q = Heap \times Local$
- $Heap = Address \to Class \times \text{seq } Value$
- $Local = Identifier \to Value$
- $Value = \mathbb{Z}, Address \subseteq \mathbb{Z}$

A state is denoted as $(heap, lcl)$, where $heap : Heap$ and $lcl : Local$.

Actions of a Java Program

An action of a Java Program is either

- the evaluation of an expression e to a value v, denoted as $e \triangleright v$, or
- a Java statement, or
- a Java code block.

Note that expressions with side-effects can modify the current state

Example: Actions of a Java Program

Post-increment expression:

$$(heap, lcl \cup \{x \mapsto 5\}) \xrightarrow{\texttt{x++}\triangleright 5} (heap, lcl \cup \{x \mapsto 6\})$$

Pre-increment expression:

$$(heap, lcl \cup \{x \mapsto 5\}) \xrightarrow{\texttt{++x}\triangleright 6} (heap, lcl \cup \{x \mapsto 6\})$$

Assignment expression:

$$(heap, lcl \cup \{x \mapsto 5\}) \xrightarrow{\texttt{x=x*2}\triangleright 10} (heap, lcl \cup \{x \mapsto 10\})$$

Assignment statement:

$$(heap, lcl \cup \{x \mapsto 5\}) \xrightarrow{\texttt{x=x*2;}} (heap, lcl \cup \{x \mapsto 10\})$$

Rules

The last slide listed some examples for transitions.
Define rules when a transition is valid.

Definition (Inference Rules)

A rule of inference

$$\frac{F_1 \dots F_n}{G}, \text{ where } \dots$$

is a decidable relation between formulae. The formulae $F_1, \dots, F_n$ are called the premises of the rule and G is called the conclusion.
If $n = 0$ the rule is called an axiom schema. In this case the bar may be omitted.

The intuition of a rule is that if all premises hold, the conclusion also holds.

Rules for Java expressions (1)

axiom for evaluating local variables:

$$(heap, lcl) \xrightarrow{x \triangleright lcl(x)} (heap, lcl)$$

rule for field access:

$$\frac{(heap, lcl) \xrightarrow{e \triangleright v} (heap', lcl')}{(heap, lcl) \xrightarrow{e.fld \triangleright heap'(v)(idx)} (heap', lcl')}$$

where idx is the index of the field fld in the object $heap'(v)$

rule for assignment to local:

$$\frac{(heap, lcl) \xrightarrow{e \triangleright v} (heap', lcl')}{(heap, lcl) \xrightarrow{x = e \triangleright v} (heap', lcl' \oplus \{x \mapsto v\})}$$

Rules for Java expressions (2)

axiom for evaluating a constant expression c:

$$(heap, lcl) \xrightarrow{c \triangleright c} (heap, lcl)$$

rule for multiplication (similar for other binary operators)

$$\frac{(heap_1, lcl_1) \xrightarrow{e_1 \triangleright v_1} (heap_2, lcl_2) \quad (heap_2, lcl_2) \xrightarrow{e_2 \triangleright v_2} (heap_3, lcl_3)}{(heap_1, lcl_1) \xrightarrow{e_1 * e_2 \triangleright (v_1 \cdot v_2) \bmod 2^{32}} (heap_3, lcl_3)}$$

A derivation for $x = x * 2$

$$\dfrac{\dfrac{(heap, lcl \cup \{x \mapsto 5\}) \xrightarrow{\texttt{x}\triangleright 5} (heap, lcl \cup \{x \mapsto 5\}) \qquad (heap, lcl \cup \{x \mapsto 5\}) \xrightarrow{2\triangleright 2} (heap, lcl \cup \{x \mapsto 5\})}{(heap, lcl \cup \{x \mapsto 5\}) \xrightarrow{\texttt{x*2}\triangleright 10} (heap, lcl \cup \{x \mapsto 5\})}}{(heap, lcl \cup \{x \mapsto 5\}) \xrightarrow{\texttt{x=x*2}\triangleright 10} (heap, lcl \cup \{x \mapsto 10\})}$$

Rules for Java Statements

expression statement (assignment or method call):

$$\frac{(heap, lcl) \xrightarrow{e \triangleright v} (heap', lcl')}{(heap, lcl) \xrightarrow{e;} (heap', lcl')}$$

sequence of statements:

$$\frac{(heap_1, lcl_1) \xrightarrow{s_1} (heap_2, lcl_2) \quad (heap_2, lcl_2) \xrightarrow{s_2} (heap_3, lcl_3)}{(heap_1, lcl_1) \xrightarrow{s_1\ s_2} (heap_3, lcl_3)}$$

Rules for Java Statements

if statement:

$$\frac{(heap_1, lcl_1) \xrightarrow{e \triangleright v} (heap_2, lcl_2) \quad (heap_2, lcl_2) \xrightarrow{bl_1} (heap_3, lcl_3)}{(heap_1, lcl_1) \xrightarrow{\textbf{if}(e)\, bl_1 \textbf{else} bl_2} (heap_3, lcl_3)}, \text{where } v \neq 0$$

$$\frac{(heap_1, lcl_1) \xrightarrow{e \triangleright v} (heap_2, lcl_2) \quad (heap_2, lcl_2) \xrightarrow{bl_2} (heap_3, lcl_3)}{(heap_1, lcl_1) \xrightarrow{\textbf{if}(e)\, bl_1 \textbf{else} bl_2} (heap_3, lcl_3)}, \text{where } v = 0$$
