

Software Design, Modelling and Analysis in UML

Lecture 08: Class Diagrams III

2011-12-06

Prof. Dr. Andreas Podelski, Dr. Bernd Westphal
Albert-Ludwigs-Universität Freiburg, Germany

- 08 - 2011.12.06 - Inhalt -

Contents & Goals

Last Lectures:

- Started to discuss "associations", the general case.

This Lecture:

- Educational Objectives:** Capabilities for following tasks/questions.
 - Cont'd: Please explain this class diagram with associations.
 - When is a class diagram a good class diagram?
 - What are purposes of modelling guidelines? (Example?)
 - Discuss the style of this class diagram.
- Content:**
 - Recall association semantics and effect on OCL.
 - Treat "the rest".
 - Where do we put OCL constraints?
 - Modelling guidelines, in particular for class diagrams (following [Ambler, 2005])
 - Examples: modelling games (made-up and real-world examples)

Recall: Associations and OCL

- 08 - 2011.12.06 - Inhalt -

3/53

Recall: What Do We (Have to) Cover

An association has

- a name,
- a reading direction, and
- at least two ends.

Each end has

- a role name,
- a multiplicity,
- a set of properties, such as **unique**, **ordered**, etc.
- a qualifier,
- a visibility,
- a navigability,
- an ownership (not in pictures),
- and possibly a diamond.

Wanted: places in the signature to represent the information from the picture.

4/53

- 08 - 2011.12.06 - Inhalt -

Recall: (Temporarily) Extend Signature: Associations

Only for the course of Lectures 07/08 we assume that each attribute in V

- either is $\langle v : \tau, \xi, expr_0, P_i \rangle$ with $\tau \in \mathcal{T}$ (as before),
- or is an association of the form

where

- $n \geq 2$ (at least two ends),
- $r, role_i$ are just names,
- the multiplicity μ_i is an expression of the form $\mu ::= * | N | N..* | N..* | \mu, \mu$ ($N, M \in \mathbb{N}$)
- P_i is a set of properties (as before),
- $\xi \in \{+, -, \#, \sim\}$ (as before),
- $\nu_i \in \{<, -, >\}$ is the navigability,
- $o_i \in \mathcal{B}$ is the ownership.

5/53

Recall: Associations in General

Recall: We consider associations of the following form:

$$\langle r : \langle role_1 : C_1, \mu_1, P_1, \xi_1, \nu_1, o_1 \rangle, \dots, \langle role_n : C_n, \mu_n, P_n, \xi_n, \nu_n, o_n \rangle \rangle$$

Only these parts are relevant for extended system states:

$$\langle r : \langle role_1 : C_1, \mu, P_1, \dots, \rangle, \dots, \langle role_n : C_n, \mu, P_n, \dots, \rangle \rangle$$

(recall: we assume $P_i = P_n = \{\text{unique}\}$).

The UML standard thinks of associations as **n-ary relations** which "live on their own" in a system state.

That is, **links** (= association instances)

- do not belong (in general) to certain objects (in contrast to pointers, e.g.)
- are "first-class citizens" next to objects,
- are (in general) not directed (in contrast to pointers).

- 08 - 2011.12.06 - Inhalt -

6/53

Recall: Links in System States

$$\langle r : (role_1 : C_1, \dots, P_1, \dots, \dots), \dots, (role_n : C_n, \dots, P_n, \dots, \dots) \rangle$$

Only for the course of this lecture we change the definition of system states:

Definition. Let \mathcal{D} be a structure of the (extended) signature $\mathcal{S} = (\mathcal{C}, \mathcal{V}, \text{atr})$.

- a type-consistent mapping

A system state of \mathcal{S} wrt. \mathcal{D} is a pair (σ, λ) consisting of

- a type-consistent mapping
- a mapping λ which assigns each association $(r : (role_1 : C_1, \dots, role_n : C_n)) \in V$ a relation $\lambda(r) \subseteq \mathcal{D}(C_1) \times \dots \times \mathcal{D}(C_n)$ (i.e. a set of type-consistent n -tuples of identities).

Handwritten notes: σ : domain objects, $\mathcal{D}(C)$: values for basic type, atr : attributes, λ : object identities, $\lambda(r)$: values for basic type, $\lambda(r)$: attrs. only

Q: should it better be

$$\lambda(r) \subseteq \text{dom}(\sigma)^n ?$$

(i.e. only all objects participate in links)

A: choice of lecture: NO

complete)
 $\hookrightarrow p$ in $2d: D$ is a dangling reference,
 $5c$ is maybe no longer attr

Example

$\sigma: \{ 1s \mapsto \{au \mapsto 1\}, 2s \mapsto \{au \mapsto 1\}, 3s \mapsto \{au \mapsto 1\}, 2s \mapsto \{au \mapsto 1\} \}$
 $\lambda_1: \{ \mapsto \{ (1s, 2s, 2s), (2s, 5s, 6s), (3s, 3s, 3s) \} \}$ // students 5s, 6s left university (x)
 // one student playing all three roles
 if (x) is not desired, add:
 context \mathcal{S} inv: $1s \neq sec$ and $sec \neq 1s$

Associations and OCL

OCL and Associations: Syntax

Recall: OCL syntax as introduced in Lecture 03, interesting part:

$$\text{expr} ::= \dots \mid \begin{array}{l} \text{role}(\text{expr}_1) : \tau_C \rightarrow \tau_D \quad r_1 : D_{0,1} \in \text{atr}(C) \\ \text{role}(\text{expr}_1) : \tau_C \rightarrow \text{Set}(\tau_D) \quad r_2 : D_n \in \text{atr}(C) \end{array}$$

Now becomes

$$\text{expr} ::= \dots \mid \begin{array}{l} \text{role}(\text{expr}_1) : \tau_C \rightarrow \tau_D \quad \mu = 0..1 \text{ or } \mu = 1 \\ \text{role}(\text{expr}_1) : \tau_C \rightarrow \text{Set}(\tau_D) \quad \text{otherwise} \end{array}$$

if $\langle r : \dots, (role : D, \mu, \dots), \dots, (role' : C, \dots), \dots \rangle \in V$ or $\langle r : \dots, (role' : C, \dots), \dots, (role : D, \mu, \dots), \dots \rangle \in V, role \neq role'$

Note:

- Association name as such doesn't occur in OCL syntax, role names do.
- expr_1 has to denote an object of a class which "participates" in the association.

OCL and Associations Syntax: Example

$$\text{expr} ::= \dots \mid \begin{array}{l} \text{role}(\text{expr}_1) : \tau_C \rightarrow \tau_D \quad \mu = 0..1 \text{ or } \mu = 1 \\ \text{role}(\text{expr}_1) : \tau_C \rightarrow \text{Set}(\tau_D) \quad \text{otherwise} \end{array}$$

if $\langle r : \dots, (role : D, \mu, \dots), \dots, (role' : C, \dots), \dots \rangle \in V$ or $\langle r : \dots, (role' : C, \dots), \dots, (role : D, \mu, \dots), \dots \rangle \in V, role \neq role'$

- context Player inv: size(year) > 0
- NOT: context Player inv: size(p) > 0
- context Player inv: size(season) > 0
- NOT: context Player inv: size(goals) > 0

OCL and Associations: Semantics

Recall: (Lecture 03)

Assume $expr_1, \tau_C$ for some $C \in \mathcal{C}$. Set $u_1 := I[expr_1][\sigma, \beta] \in \mathcal{D}(\tau_C)$.

- $I[r_1(expr_1)](\sigma, \beta) := \begin{cases} u & \text{if } u_1 \in \text{dom}(\sigma) \text{ and } \sigma(u_1)(r_1) = \{u\} \\ \perp & \text{otherwise} \end{cases}$
- $I[r_2(expr_1)](\sigma, \beta) := \begin{cases} \sigma(u_1)(r_2) & \text{if } u_1 \in \text{dom}(\sigma) \\ \perp & \text{otherwise} \end{cases}$

Now needed:

$$I[role(expr_1)](\sigma, \lambda, \beta)$$

- We cannot simply write $\sigma(u)(role)$.
- Recall: **role** is (for the moment) not an attribute of object u (not in $atr(C)$).
- What we have is $\lambda(r)$ (with r , not with $role!$) — but it yields a set of n -tuples, of which some relate u and other some instances of D .
- $role$ denotes the position of the D 's in the tuples constituting the value of r .

OCL and Associations: Semantics Cont'd

Assume $expr_1 : \tau_C$ for some $C \in \mathcal{C}$. Set $u_1 := I[expr_1][(\sigma, \lambda), \beta] \in \mathcal{D}(\tau_C)$.

$$I[role(expr_1)](\sigma, \lambda, \beta) := \begin{cases} u & \text{if } u_1 \in \text{dom}(\sigma) \text{ and } L(role)(u_1, \lambda) = \{u\} \\ \perp & \text{otherwise} \end{cases}$$

$$I[role(expr_1)](\sigma, \lambda, \beta) := \begin{cases} L(role)(u_1, \lambda) & \text{if } u_1 \in \text{dom}(\sigma) \\ \perp & \text{otherwise} \end{cases}$$

where

"database lookup"
 $L(role)(u, \lambda) = \{(u_1, \dots, u_n) \in \lambda(r) \mid u \in \{u_1, \dots, u_n\}\} \downarrow i$
 select those tuples where u occurs at some position
 project onto the i -th comp.
 assume r is univocally determined by role

if

$$(r : \dots (role_1 : \dots) \dots (role_n : \dots) \dots), role = role_i$$

Given a set of n -tuples A , $A \downarrow i$ denotes the element-wise projection onto the i -th component.

OCL and Associations Example

$$I[role(expr_1)](\sigma, \lambda, \beta) := \begin{cases} L(role)(u_1, \lambda) & \text{if } u_1 \in \text{dom}(\sigma) \\ \perp & \text{otherwise} \end{cases}$$

$$L(role)(u, \lambda) = \{(u_1, \dots, u_n) \in \lambda(r) \mid u \in \{u_1, \dots, u_n\}\} \downarrow i$$

$$\sigma = \{1_C \mapsto \emptyset, 3_D \mapsto \{x \mapsto 1\}, 7_D \mapsto \{x \mapsto 2\}\}$$

$$\lambda = \{A.C.D \mapsto \{(1_C, 3_D), (1_C, 7_D)\}\}$$

$$I[self, n][\sigma, \lambda, \{self \mapsto 1_C\}] = I[\perp, n(\text{self})][\sigma, \lambda, \{self \mapsto 1_C\}]$$

$$= \perp$$

$$= L(u_1)(\perp, \lambda)$$

$$= \{(1_C, 3_D), (1_C, 7_D)\} \downarrow 2$$

$$= \{3_D, 7_D\}$$

Associations: The Rest

The Rest

Recapitulation: Consider the following association:

$$(r : \langle role_1 : C_1, \mu_1, P_1, \xi_1, \nu_1, o_1 \rangle, \dots, \langle role_n : C_n, \mu_n, P_n, \xi_n, \nu_n, o_n \rangle)$$

- Association name r and role names/types $role_i/C_i$ induce extended system states λ .
- Multiplicity μ is considered in OCL syntax.
- Visibility ξ / Navigability ν : well-typedness.

Now the rest:

- Multiplicity μ : we propose to view them as constraints.
- Properties P_i : even more typing.
- Ownership o : getting closer to pointers/references.
- Diamonds: exercise.
