DPLL(T)

Suppose we have a  $T_{\mathbb{Q}}$ -formulae that is not conjunctive:

$$(x \geq 0 \rightarrow y > z) \wedge (x + y \geq z \rightarrow y \leq z) \wedge (y \geq 0 \rightarrow x \geq 0) \wedge x + y \geq z$$

Our approach so far: Converting to DNF.

Yields in 8 conjuncts that have to be checked separately.

Is there a more efficient way to prove unsatisfiability?

Suppose we have the following  $T_{\mathbb{Q}}$ -formulae:

$$(x \geq 0 \rightarrow y > z) \wedge (x + y \geq z \rightarrow y \leq z) \wedge (y \geq 0 \rightarrow x \geq 0) \wedge x + y \geq z$$

Converting to CNF and restricting to  $\leq$ :

$$\begin{aligned} &(\neg(0 \leq x) \vee \neg(y \leq z)) \wedge (\neg(z \leq x + y) \vee (y \leq z)) \\ &\quad \wedge (\neg(0 \leq y) \vee (0 \leq x)) \wedge (z \leq x + y) \end{aligned}$$

Now, introduce boolean variables for each atom:

$$P_1 : 0 \leq x$$

$$P_2 : y \leq z$$

$$P_3 : z \leq x + y$$

$$P_4 : 0 \leq y$$

Gives a propositional formula:

$$(\neg P_1 \vee \neg P_2) \wedge (\neg P_3 \vee P_2) \wedge (\neg P_4 \vee P_1) \wedge P_3$$

The core feature of the DPLL-algorithm is Unit Propagation.

$$(\neg P_1 \vee \neg P_2) \wedge (\neg P_3 \vee P_2) \wedge (\neg P_4 \vee P_1) \wedge P_3$$

The clause  $P_3$  is a unit clause; set  $P_3$  to  $\top$ .

Then  $\neg P_3 \vee P_2$  is a unit clause; set  $P_2$  to  $\top$ .

Then  $\neg P_1 \vee \neg P_2$  is a unit clause; set  $P_1$  to  $\perp$ .

Then  $\neg P_4 \vee P_1$  is a unit clause; set  $P_4$  to  $\perp$ .

Only solution is  $P_3 \wedge P_2 \wedge \neg P_1 \wedge \neg P_4$ .

Only solution is  $P_3 \wedge P_2 \wedge \neg P_1 \wedge \neg P_4$ .

$$P_1 : 0 \leq x$$

$$P_2 : y \leq z$$

$$P_3 : z \leq x + y$$

$$P_4 : 0 \leq y$$

This gives the **conjunctive**  $T_Q$ -formula

$$z \leq x + y \wedge y \leq z \wedge x < 0 \wedge y < 0.$$

We describe DPLL(T) by a set of rules modifying a configuration.  
A configuration is a triple

$$\langle M, F, C \rangle,$$

where

- $M$  (model) is a sequence of literals (that are currently set to true) interspersed with backtracking points denoted by  $\square$ .
- $F$  (formula) is a formula in CNF, i. e., a set of clauses where each clause is a set of literals.
- $C$  (conflict) is either  $\top$  or a conflict clause (a set of literals). A conflict clause  $C$  is a clause with  $F \Rightarrow C$  and  $M \not\models C$ . Thus, a conflict clause shows  $M \not\models F$ .

We describe the algorithm by a set of rules, which each describe a set of transitions between configurations, e. g.,

Explain  $\frac{\langle M, F, C \cup \{l\} \rangle}{\langle M, F, C \cup \{l_1, \dots, l_k\} \rangle}$  where  $l \notin C$ ,  $\{l_1, \dots, l_k, \bar{l}\} \in F$ ,  
and  $\bar{l}_1, \dots, \bar{l}_k \prec \bar{l}$  in  $M$ .

Here,  $\bar{l}_1, \dots, \bar{l}_k \prec \bar{l}$  in  $M$  means the literals  $\bar{l}_1, \dots, \bar{l}_k$  occur in the sequence  $M$  before the literal  $\bar{l}$  (and all literals appear in  $M$ ).

**Example:** for  $M = P_1 \bar{P}_3 \bar{P}_2 \bar{P}_4$ ,  $F = \{\{P_1\}, \{P_3, \bar{P}_4\}\}$ , and  $C = \{P_2\}$  the transition

$$\langle M, F, \{P_2, P_4\} \rangle \longrightarrow \langle M, F, \{P_2, P_3\} \rangle$$

is possible.

$$\text{Decide } \frac{\langle M, F, \top \rangle}{\langle M \cdot \square \cdot l, F, \top \rangle}$$

where  $l \in \text{lit}(F)$ ,  $l, \bar{l} \notin M$

$$\text{Propagate } \frac{\langle M, F, \top \rangle}{\langle M \cdot l, F, \top \rangle}$$

where  $\{l_1, \dots, l_k, l\} \in F$   
and  $\bar{l}_1, \dots, \bar{l}_k \in M$ ,  $l, \bar{l} \notin M$ .

$$\text{Conflict } \frac{\langle M, F, \top \rangle}{\langle M, F, \{l_1, \dots, l_k\} \rangle}$$

where  $\{l_1, \dots, l_k\} \in F$   
and  $\bar{l}_1, \dots, \bar{l}_k \in M$ .

$$\text{Explain } \frac{\langle M, F, C \cup \{l\} \rangle}{\langle M, F, C \cup \{l_1, \dots, l_k\} \rangle}$$

where  $l \notin C$ ,  $\{l_1, \dots, l_k, \bar{l}\} \in F$ ,  
and  $\bar{l}_1, \dots, \bar{l}_k \prec \bar{l}$  in  $M$ .

$$\text{Learn } \frac{\langle M, F, C \rangle}{\langle M, F \cup \{C\}, C \rangle}$$

where  $C \neq \top$ ,  $C \notin F$ .

$$\text{Back } \frac{\langle M, F, \{l_1, \dots, l_k, l\} \rangle}{\langle M' \cdot l, F, \top \rangle}$$

where  $\{l_1, \dots, l_k, l\} \in F$ ,  
 $M = M' \cdot \square \dots \bar{l} \dots$ ,  
and  $\bar{l}_1, \dots, \bar{l}_k \in M'$ .

$$P_1 \wedge (\neg P_2 \vee P_3) \wedge (\neg P_4 \vee P_3) \wedge (P_2 \vee P_4) \wedge (\neg P_1 \vee \neg P_4 \vee \neg P_3) \wedge (P_4 \vee \neg P_3)$$

The algorithm starts with  $M = \epsilon$ ,  $C = \top$  and  
 $F = \{\{P_1\}, \{\bar{P}_2, P_3\}, \{\bar{P}_4, P_3\}, \{P_2, P_4\}, \{\bar{P}_1, \bar{P}_4, \bar{P}_3\}, \{P_4, \bar{P}_3\}\}$ .

$$\begin{aligned} &\langle \epsilon, F, \top \rangle \xrightarrow{\text{Propagate}} \langle P_1, F, \top \rangle \xrightarrow{\text{Decide}} \langle P_1 \square \bar{P}_2, F, \top \rangle \xrightarrow{\text{Propagate}} \\ &\langle P_1 \square \bar{P}_2 P_4, F, \top \rangle \xrightarrow{\text{Propagate}} \langle P_1 \square \bar{P}_2 P_4 P_3, F, \top \rangle \xrightarrow{\text{Conflict}} \\ &\langle P_1 \square \bar{P}_2 P_4 P_3, F, \{\bar{P}_1, \bar{P}_4, \bar{P}_3\} \rangle \xrightarrow{\text{Explain}} \langle P_1 \square \bar{P}_2 P_4 P_3, F, \{\bar{P}_1, \bar{P}_4\} \rangle \xrightarrow{\text{Learn}} \\ &\langle P_1 \square \bar{P}_2 P_4 P_3, F', \{\bar{P}_1, \bar{P}_4\} \rangle \xrightarrow{\text{Back}} \langle P_1 \bar{P}_4, F', \top \rangle \xrightarrow{\text{Propagate}} \\ &\langle P_1 \bar{P}_4 P_2 P_3, F', \top \rangle \xrightarrow{\text{Conflict}} \langle P_1 \bar{P}_4 P_2 P_3, F', \{P_4, \bar{P}_3\} \rangle \xrightarrow{\text{Explain}} \\ &\langle P_1 \bar{P}_4 P_2 P_3, F', \{P_4, \bar{P}_2\} \rangle \xrightarrow{\text{Explain}} \langle P_1 \bar{P}_4 P_2 P_3, F', \{P_4\} \rangle \xrightarrow{\text{Explain}} \\ &\langle P_1 \bar{P}_4 P_2 P_3, F', \{\bar{P}_1\} \rangle \xrightarrow{\text{Explain}} \langle P_1 \bar{P}_4 P_2 P_3, F', \emptyset \rangle \xrightarrow{\text{Learn}} \\ &\langle P_1 \bar{P}_4 P_2 P_3, F' \cup \{\emptyset\}, \emptyset \rangle \end{aligned}$$

where  $F' = F \cup \{\{\bar{P}_1, \bar{P}_4\}\}$ .

The DPLL/CDCL algorithm is combined with a Decision Procedures for a Theory

DPLL takes the **propositional core** of a formula, assigns truth-values to **atoms**.

Theory takes a **conjunctive** formula (conjunction of literals), returns a **minimal unsatisfiable core**.

Suppose we have a decision procedure for a conjunctive theory, e.g., Simplex Algorithm for  $T_{\mathbb{Q}}$ .

Given an unsatisfiable conjunction of literals  $l_1 \wedge \dots \wedge l_n$ .

Find a subset  $\text{UnsatCore} = \{l_{i_1}, \dots, l_{i_m}\}$ , such that

- $l_{i_1} \wedge \dots \wedge l_{i_m}$  is unsatisfiable.
- For each subset of **UnsatCore** the conjunction is satisfiable.

Possible approach: check for each literal whether it can be omitted.

→  $n$  calls to decision procedure.

Most decision procedures can give small unsatisfiable cores for free.

Theory returns an unsatisfiable core:

- a conjunction of literals from current truth assignment
- that is unsatisfiable.

DPLL learns conflict clauses, a disjunction of literals

- that are implied by the formula
- and in conflict to current truth assignment.

Thus the negation of an unsatisfiable core is a conflict clause.

The DPLL part only needs one new rule:

TConflict  $\frac{\langle M, F, \top \rangle}{\langle M, F, C \rangle}$  where  $M$  is unsatisfiable in the theory  
and  $\neg C$  an unsatisfiable core of  $M$ .

$$F : y \geq 1 \wedge (x \geq 0 \rightarrow y \leq 0) \wedge (x \leq 1 \rightarrow y \leq 0)$$

Atomic propositions:

$$P_1 : y \geq 1$$

$$P_2 : x \geq 0$$

$$P_3 : y \leq 0$$

$$P_4 : x \leq 1$$

Propositional core of  $F$  in CNF:

$$F_0 : (P_1) \wedge (\neg P_2 \vee P_3) \wedge (\neg P_4 \vee P_3)$$

$$F_0 : \{ \{P_1\}, \{\bar{P}_2, P_3\}, \{\bar{P}_4, P_3\} \}$$

$$P_1 : y \geq 1 \quad P_2 : x \geq 0 \quad P_3 : y \leq 0 \quad P_4 : x \leq 1$$

$$\begin{aligned} &\langle \epsilon, F_0, \top \rangle \xrightarrow{\text{Propagate}} \langle P_1, F_0, \top \rangle \xrightarrow{\text{Decide}} \langle P_1 \square P_3, F_0, \top \rangle \xrightarrow{\text{TConflict}} \\ &\langle P_1 \square P_3, F_0, \{\bar{P}_1, \bar{P}_3\} \rangle \xrightarrow{\text{Learn}} \langle P_1 \square P_3, F_1, \{\bar{P}_1, \bar{P}_3\} \rangle \xrightarrow{\text{Back}} \\ &\langle P_1 \bar{P}_3, F_1, \top \rangle \xrightarrow{\text{Propagate}} \langle P_1 \bar{P}_3 \bar{P}_2, F_1, \top \rangle \xrightarrow{\text{Propagate}} \\ &\langle P_1 \bar{P}_3 \bar{P}_2 \bar{P}_4, F_1, \top \rangle \xrightarrow{\text{TConflict}} \langle P_1 \bar{P}_3 \bar{P}_2 \bar{P}_4, F_1, \{P_2, P_4\} \rangle \xrightarrow{\text{Explain}} \\ &\langle P_1 \bar{P}_3 \bar{P}_2 \bar{P}_4, F_1, \{P_2, P_3\} \rangle \xrightarrow{\text{Explain}} \langle P_1 \bar{P}_3 \bar{P}_2 \bar{P}_4, F_1, \{P_3\} \rangle \xrightarrow{\text{Explain}} \\ &\langle P_1 \bar{P}_3 \bar{P}_2 \bar{P}_4, F_1, \{\bar{P}_1\} \rangle \xrightarrow{\text{Explain}} \langle P_1 \bar{P}_3 \bar{P}_2 \bar{P}_4, F_1, \emptyset \rangle \xrightarrow{\text{Learn}} \\ &\langle P_1 \bar{P}_3 \bar{P}_2 \bar{P}_4, F_1 \cup \{\emptyset\}, \emptyset \rangle \end{aligned}$$

$$\text{where } F_1 := F_0 \cup \{ \{ \bar{P}_1, \bar{P}_3 \} \}$$

No further step is possible; the formula  $F$  is unsatisfiable.

## Theorem (Correctness of DPLL(T))

Let  $F$  be a  $\Sigma$ -formula and  $F'$  its propositional core. Let

$$\langle \epsilon, F', \top \rangle = \langle M_0, F_0, C_0 \rangle \longrightarrow \dots \longrightarrow \langle M_n, F_n, C_n \rangle$$

be a maximal sequence of rule application of DPLL(T).

Then  $F$  is  $T$ -satisfiable iff  $C_n$  is  $\top$ .

Before proving the theorem, we note some important invariants:

- $M_i$  never contains a literal more than once.
- $M_i$  never contains  $\ell$  and  $\bar{\ell}$ .
- Every  $\square$  in  $M_i$  is followed immediately by a literal.
- If  $C_i = \{\ell_1, \dots, \ell_k\}$  then  $\bar{\ell}_1, \dots, \bar{\ell}_k$  in  $M$ .
- $C_i$  is always implied by  $F_i$  (or the theory).
- $F$  is equivalent to  $F_i$  for all steps  $i$  of the computation.
- If a literal  $\ell$  in  $M$  is not immediately preceded by  $\square$ , then  $F$  contains a clause  $\{\ell, \ell_1, \dots, \ell_k\}$  and  $\bar{\ell}_1, \dots, \bar{\ell}_k \prec \ell$  in  $M$ .

# Correctness proof

**Proof:** If the sequence ends with  $\langle M_n, F_n, \top \rangle$  and there is no rule applicable, then:

- Since **Decide** is not applicable, all literals of  $F_n$  appear in  $M_n$  either positively or negatively.
- Since **Conflict** is not applicable, for each clause at least one literal appears in  $M_n$  positively.
- Since **TConflict** is not applicable, the conjunction of truth assignments of  $M_n$  is satisfiable by a model  $I$ .

Thus,  $I$  is a model for  $F_n$ , which is equivalent to  $F$ .

If the sequence ends with  $\langle M_n, F_n, C_n \rangle$  with  $C_n \neq \top$ .

Assume  $C_n = \{\bar{l}_1, \dots, \bar{l}_k, l\} \neq \emptyset$ . W.l.o.g.,  $\bar{l}_1, \dots, \bar{l}_k \prec l$ . Then:

- Since **Learn** is not applicable,  $C_n \in F_n$ .
- Since **Explain** is not applicable  $\bar{l}$  must be immediately preceded by  $\square$ .
- However, then **Back** is applicable, contradiction!

Therefore, the assumption was wrong and  $C_n = \emptyset (= \perp)$ .

Since  $F$  implies  $C_n$ ,  $F$  is not satisfiable.

## Theorem (Termination of DPLL)

Let  $F$  be a propositional formula. Then every sequence

$$\langle \epsilon, F, \top \rangle = \langle M_0, F_0, C_0 \rangle \longrightarrow \langle M_1, F_1, C_1 \rangle \longrightarrow \dots$$

*terminates.*

# Proof of Total Correctness

We define some well-ordering on the domains:

- We define  $M \prec M'$  if  $M \square \square$  comes lexicographically before  $M' \square \square$ , where every literal is considered to be smaller than  $\square$ .

**Example:**  $l_1 l_2(\square \square) \prec l_1 \square \bar{l}_2 l_3(\square \square) \prec l_1 \square \bar{l}_2(\square \square) \prec l_1(\square \square)$

- For a sequence  $M = \bar{l}_1 \dots \bar{l}_n$ , the conflict clauses are ordered by:

$C \prec_M C'$ , iff  $C \neq \top$ ,  $C' = \top$  or for some  $k \leq n$ :

$C \cap \{l_{k+1}, \dots, l_n\} = C' \cap \{l_{k+1}, \dots, l_n\}$  and  $l_k \notin C, l_k \in C'$ .

**Example:**  $\emptyset \prec_{\bar{l}_1 \bar{l}_2 \bar{l}_3} \{l_2\} \prec_{\bar{l}_1 \bar{l}_2 \bar{l}_3} \{l_1, l_3\} \prec_{\bar{l}_1 \bar{l}_2 \bar{l}_3} \{l_2, l_3\} \prec_{\bar{l}_1 \bar{l}_2 \bar{l}_3} \top$

These are **well-orderings**, because the domains are finite.

**Termination Proof:** Every rule application decreases the value of  $\langle M_i, F_i, C_i \rangle$  according to the well-ordering:

$$\langle M, F, C \rangle \prec \langle M', F', C' \rangle, \text{ iff } \begin{cases} M \prec M', \\ \text{or } M = M', C \prec_M C', \\ \text{or } M = M', C = C', C \in F, C \notin F'. \end{cases}$$
