## Subject of the Lecture

## Real-Time Systems

## Contents & Goals

### Last Lecture: • ./.

### This Lecture:

- Educational Objectives:
   Ba able to decide whether you want to stay with us or not.
   (IOW: an adventisement for the lecture.)
   Agree on formalia.

Lecture 01: Introduction Real-Time Systems

- Overview: content (and non-content) of the lecture.
   Definition reactive, real-time, hybrid system.
   Outlook on methodology for precise development of (provably) correct real-time systems.
   Formalia: date/nimes, exercises, exam admission.
   Literature A formal model of real-time behaviour.

Albert-Ludwigs-Universität Freiburg, Germany

Dr. Bernd Westphal

2013-04-16

2/37

### Introduction

## What is a Real-Time System?

What is a Real-Time System?

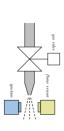

Classical example: Airbag Controller

crash

Controller

fire

## Other example: Gas Burner

- Leakage is practically unavoidable:
   for ignition, first open valve
   then ignite the available gas
   ignition may fail...

Say, 300ms (plus/minus small  $\varepsilon$ ) after a crash is the  $\underline{rgpt}_{\Sigma}^{TM}$  time to fire. Then the precise requirement is "When a crash is detected at time t, fire the airbag at  $t+300ms\pm\varepsilon$ ."

5/37

Requirement: "When a crash is detected, fire the airbag."

When firing too early: airbag ineffective.
 When firing too late: additional threat.

Leakage is safety critical: Igniting large amounts of leaked gas may lead to a dangerous explosion.

# No, Really, What is a Real-Time System?

 The examples have in common that it matters, when in time

the output for a given input (sequence) takes place

 within any interval of at least 60s, leaplage (= have the gas valve open without a flame) amounts to at most 5% of the time.
 Note: quantitative (here) vs. qualitative notions of time (untimed). For instance,

"fire" 300ms after "crash",

Often: There is a physical environment, which has a notion of time, and which evolves while our controller is computing.

(Half-)Contrast: vending machine for soft-drinks:

 Neither the usage of a really fast or a really slow contemporary controller causes a violation of If the customer is really thirsty, she'll wait. (timing) requirements.

(Real) Contrast: transformational systems, such as computing π.

# Other Definitions [Douglass, 1999]

- "A real-time system is one that has performance deadlines on its computations and actions."
- "Hard deadlines: performance requirements that absolutely must be met each and every event or time mark."

  "(Lare/data can be bad data.)"

   "Soft deadlines: for instance about average response times."

  "(Late data is still good.)"

- Design Goal: A timely system, i.e. one meeting its performance requirements
- Note: performance can in general be any unit of quantities:
   (discrete) number of steps or processor instructions,
   (discrete or continuous) number of seconds,

0/3

# The Problem: Constructing Safety-critical RT Systems

The Problem: Constructing Safety-critical RT Systems

• Reactive systems can be partioned into:

- "In constructing a real-time system the aim is to control a physically existing environment, the plant, in such a way that the controlled plant satisfies all desired (timing) requirements."
- The design of safety critical (reactive) systems requires a high degree of precision:
- We want at best to be sure that a design meets its requirements.
- Real-time systems are often safety-critical.
- The lecture presents approaches for the precise development of real-time systems based on formal, mathematical methods.

10/37

10/37

# Definitions: Reactive vs. Real-Time vs. Hybrid Systems

- Reactive Systems interact with their environment by reacting to inputs from the environment with certain outputs.
- has to compute the corresponding outputs within given time bounds. A Real-Time System is a reactive system which, for certain inputs,
- A Hybrid System is a real-time system consisting of continuous and discrete components. The continuous components are time-dependent (!) physical variables ranging over a continous value set.
- A system is called Safety Critical if and only if a malfunction can cause loss of goods, money, or even life.

Constructing Safety-critical RT Systems: Examples

"When a crash is detected at time t, fire the airbag at  $t+300ms\pm \varepsilon$ ."

A controller program is easy:

while (true) do
poll\_sensors();
if (crash) tmr.start(300ms);
if (tmr.elapsed()) fire := 1;
update\_actuators();

And likely to be believed to be correct.

11/37

# Constructing Safety-critical RT Systems: Examples

More complicated: additional features

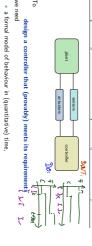

More complicated: distributed implementation.

12/37

# Prerequisites for Precise Development of Real-Time Systems

\* a language to concisely, conveniently specify requirements on behaviour,  $\coprod_{\beta} ( \operatorname{fic} ) \to \operatorname{fit} ( )$  where  $\operatorname{find} ( \operatorname{fic} )$  with  $\operatorname{find} ( \operatorname{find} )$  with  $\operatorname{find} ( \operatorname{find} )$ 

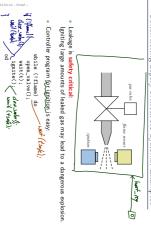

Then we can devise a methodology to get from requirements to a (correct) implementation — here: following [Olderog and Dierks, 2008].

Lon all subimbounds

# Constructing Safety-critical RT Systems: Examples

Prerequisites for Precise Development of Real-Time Systems

sersors

Is it correct? (Here: Is it avoiding dangerous explosions?)

13/37

# we need a formal model of behaviour in (quantitative) time,

design a controller that (provably) meets its requ

Then we can devise a methodology to get from requirements to a (correct) implementation — here: following [Olderog and Dierks, 2008].

14/37

# Prerequisites for Precise Development of Real-Time Systems

we need design a controller that (provably) meets its requirements

- a formal model of behaviour in (quantitative) time,
- a language to specify behaviour of controllers, a language to concisely, conveniently specifiy requirements on behaviour,
- a notion of "meet" and a methodology to verify (or prove) "meeting".

Then we can devise a methodology to get from requirements to a (correct) implementation — here: following [Olderog and Dierks, 2008].

# Sketch of the Methodology: Gas Burner Example

Requirements

At most 5% of any at least 60s long interval amounts to leakage.

Reflective Design

Time intervals with leakage last at most 1s.
 After each leak, wait 30s before opening valve again.

Constructive Design

PLC Automaton (open valve for 0.5s; ignite; ignite; ignite; in fin on flame after 0.1s close valve) • Implementation (geouse)
• IEC 61131-3 program
• PLC / SPS

Content Overview

16/37

Maybe-Content

Worst Case Execution Time

 Recall over-simplified airbag controller: while (true) do
poll\_sensors();A

if (crash) tur.start(300ms);

if (tur.elapsed()) fire := 1;

update\_actuators() A
od

The execution of poll\_sensors() and update\_actuators() also takes time! (And we have to consider it!)

Maybe in lecture:
 How to determine the WCET of, for instance, C code.
 (A science of its own.)

Content

 First-order Logic Duration Calculus (DC) Semantical Correctness Proofs with DC Timed Automata (TA), Uppaal
 Networks of Timed Automata
 Region/Zone-Abstraction Extended Timed Automata

 $obs: \mathsf{Time} \to \mathscr{D}(obs)$ 

PLC-Automata

 DC Implementables DC Decidability

Undecidability Results

(obso, vo), to a (obs1, v1), to the (ds, 4), tit

Recap ...whether TA satisfies DC formula, observer-based

Automatic Verification...

17/37

Non-Content

Scheduling
 Recall over-simplified airbag controller:

Not in lecture: Specialised methods to determine...

...whether the bus provides sufficient bandwidth.

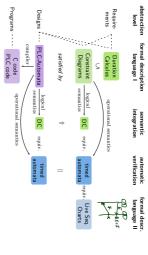

...whether the Real-Time OS controlling CPU 'Controller' schedules the airbag control code in time.

...how to distribute tasks over multiple CPUs.

(Also a science of its own.)

20/37

Tying It All Together

18/37

Formalia

21/37

### Formalia: Event

- Lecturer: Dr. Bernd Westphal
- Support: Dennis Gauss
- Homepage:

http://swt.informatik.uni-freiburg.de/teaching/SS2013/rtsys

### Questions:

(i) ask immediately or in the break

"offline"

(i) try to solve yourself
(ii) discuss with colleagues
(iii) contact lecturer by mail (cf. homepage) or just drop by:
Building 52, Room 00-020

22/37

# Formalia: Exercises and Tutorials

Formalia: Exam

Exam Admission:

Exam Form: (oral or written) not yet decided

50% of the maximum possible non-bonus  $\mbox{\bf good-will points}$  in total are sufficient for admission to exam

### Schedule/Submission:

- Recall: exercises online on Wednesday before (or soon after) lecture, regular turn in on corresponding tutorial day until 14:00 local time e should work in groups of max. 3, clearly give names on submission e please submit electronically by Mail to me (cf. homepage), some BTEX styles on homepage; paper submissions are tolerated

### Didactical aim:

deal more extensively with notions from lecture
 explore corner cases or alternatives

(easy) (medium) (difficult)

- evaluate/appreciate approaches
- additional difficulty: imprecise/unclear tasks by intention
- True aim: most complicated rating system ever, namely two ratings

  >- Good-will ("reasonable solution with knowledge before tutorial" Evil/Exam ("reasonable solution with knowledge before tutorial")
  ("reasonable solution with knowledge after tutorial")

10% bonus for early submission.

## Formalia: Dates/Times, Break

Formalia: Lectures

### $\begin{tabular}{ll} \begin{tabular}{ll} \beg$ Schedule: With a prefix of lectures, with public holidays; see homepage for details. Wednesday, week N: 10-12 lecture Monday, week N + 2: 14:00 Wednesday, week N+1: 10–12 lecture Tuesday, week N+1: 14-16 lecture (exercises M late turn-in) (exercises M early turn-in) (exercises M+1 online) (exercises M online)

Tuesday, Wednesday: here

Script/Media:

 slides with annotations on homepage, 2-up for printing, typically soon after the lecture slides without annotations on homepage,
 trying to put them there before the lecture

recording on electures portal with max. 1 week delay (link on homepage – electures is updated first, look there!)

 Presentation:
 half slides/half on-screen hand-writing — for reasons • Course language: English (slides/writing, presentation, questions/discussions)

Unless a majority objects now, we'll have a 10 min. break in the middle of each event from now on.

23/37

Interaction: absence often moaned but it takes two, so please ask/comment immediately

24/37

## Formalia: Evaluation

Speaking of grading and examination...

Mid-term Evaluation:
 We will have a mid-term evaluation<sup>a</sup>, but we're always interested in comments/hints/proposals concerning form or content.

<sup>a</sup>that is, students are asked to evaluate lecture, lecturer, and tutor...

26/37
