Tell Them What You've Told Them. . .

- **Requirements Documents** are **important** – e.g., for
 - negotiation, design & implementation, documentation, testing, delivery, re-use, re-implementation.
- A **Requirements Specification** should be
 - correct, complete, relevant, consistent, neutral, traceable, objective.

Note: vague vs. abstract.
- **Requirements Representations** should be
 - easily understandable, precise, easily maintainable, easily usable
- **Distinguish**
 - hard / soft,
 - functional / non-functional,
 - open / tacit.
- It is the task of the **analyst** to **elicit** requirements.
- Natural language is inherently imprecise, counter-measures:
 - natural language patterns.
- Do not underestimate the value of a good **dictionary**.

Decision Tables

-7- 2017-05-29 - Scoreet -

9/49

- 7 - 2017-05-29 - Scoreet -

- 10/49

T : decision table		r_1	$\dots$	r_n
c_1	description of condition c_1	$w_{1,1}$	$\dots$	$w_{1,n}$
$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$
c_m	description of condition c_m	$w_{m,1}$	$\dots$	$w_{m,n}$
a_1	description of action a_1	$w_{1,1}$	$\dots$	$w_{1,n}$
$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$
a_k	description of action a_k	$w_{k,1}$	$\dots$	$w_{k,n}$

Decision Table Syntax

- Let C be a set of **conditions** and A be a set of **actions** s.t. $C \cap A = \emptyset$.
- A **decision table** T over C and A is a labelled $(m + k) \times n$ matrix

T: decision table		r_1	$\dots$	r_n
c_1	description of condition c_1	$v_{1,1}$	$\dots$	$v_{1,n}$
$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$
c_m	description of condition c_m	$v_{m,1}$	$\dots$	$v_{m,n}$
a_1	description of action a_1	$w_{1,1}$	$\dots$	$w_{1,n}$
$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$
a_k	description of action a_k	$w_{k,1}$	$\dots$	$w_{k,n}$

- where
 - $c_1, \dots, c_m \in C$,
 - $a_1, \dots, a_k \in A$,
 - $v_{1,1}, \dots, v_{m,n} \in \{-, \times, *\}$ and
 - $w_{1,1}, \dots, w_{k,n} \in \{-, \times\}$.
- Columns $(v_{1,i}, \dots, v_{m,i}, w_{1,i}, \dots, w_{k,i}), 1 \leq i \leq n$, are called **rules**,
- $r_1, \dots, r_n$ are **rule names**.
- $(v_{1,i}, \dots, v_{m,i})$ is called **premise** of rule r_i ,
- $(w_{1,i}, \dots, w_{k,i})$ is called **effect** of r_i .

-7-2017-05-19 - Scorenet -

10/49

Decision Table Semantics

Each rule $r \in \{r_1, \dots, r_n\}$ of table T

T: decision table		r_1	$\dots$	r_n
c_1	description of condition c_1	$v_{1,1}$	$\dots$	$v_{1,n}$
$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$
c_m	description of condition c_m	$v_{m,1}$	$\dots$	$v_{m,n}$
a_1	description of action a_1	$w_{1,1}$	$\dots$	$w_{1,n}$
$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$
a_k	description of action a_k	$w_{k,1}$	$\dots$	$w_{k,n}$

is assigned to a **propositional logical formula** $\mathcal{F}(r)$ over signature $C \cup A$ as follows:

- Let $(v_1, \dots, v_m)$ and $(w_1, \dots, w_k)$ be premise and effect of r .
- Then

$$\mathcal{F}(r) := \underbrace{F(v_1, c_1) \wedge \dots \wedge F(v_m, c_m)}_{=: \mathcal{F}_{pre}(r)} \wedge \underbrace{F(w_1, a_1) \wedge \dots \wedge F(w_k, a_k)}_{=: \mathcal{F}_{eff}(r)}$$

where

$$F(v, x) = \begin{cases} x & , \text{if } v = \times \\ \neg x & , \text{if } v = - \\ \text{true} & , \text{if } v = * \end{cases}$$

-7-2017-05-19 - Scorenet -

11/49

Decision Table Semantics: Example

$$\mathcal{F}(r) := F(v_1, c_1) \wedge \cdots \wedge F(v_m, c_m) \\ \wedge F(v_1, a_1) \wedge \cdots \wedge F(v_k, a_k)$$

$$F(v, x) = \begin{cases} x & , \text{if } v = \times \\ \neg x & , \text{if } v = - \\ \text{true} & , \text{if } v = * \end{cases}$$

T		r_1	r_2	r_3
c_1		$\times$	$\times$	$-$
c_2		$\times$	$-$	$*$
c_3		$-$	$\times$	$*$
a_1		$\times$	$-$	$-$
a_2		$-$	$\times$	$-$

- $\mathcal{F}(r_1) = F(\times, c_1) \wedge F(\times, c_2) \wedge F(-, c_3) \wedge F(\times, a_1) \wedge F(-, a_2)$
 $= c_1 \wedge c_2 \wedge \neg c_3 \wedge a_1 \wedge \neg a_2$
- $\mathcal{F}(r_2) = c_1 \wedge \neg c_2 \wedge c_3 \wedge \neg a_1 \wedge a_2$
- $\mathcal{F}(r_3) = \neg c_1 \wedge \text{true} \wedge \text{true} \wedge \neg a_1 \wedge \neg a_2$
 $\Leftrightarrow \neg c_1 \wedge \neg a_1 \wedge \neg a_2$

12/49

Decision Tables as Requirements Specification

-7-2017-05-29 - main -

13/49

We can use decision tables to **model** (describe or prescribe) the behaviour of **software**!

Example:

Ventilation system of
lecture hall 101-O-026.

T: room ventilation		r ₁	r ₂	r ₃
b	button pressed?	x	x	—
off	ventilation off?	x	—	*
on	ventilation on?	—	x	*
go	start ventilation	x	—	—
stop	stop ventilation	—	x	—

- We can **observe** whether **button is pressed** and whether room ventilation is **on or off**, and whether (we intend to) **start ventilation** of **stop ventilation**.

- We can model our observation by a boolean valuation $\sigma : C \cup A \rightarrow \mathbb{B}$, e.g., set

$\sigma(b) := \text{true}$, if button pressed now and $\sigma(b) := \text{false}$, if button not pressed now.

$\sigma(go) := \text{true}$, we plan to start ventilation and $\sigma(go) := \text{false}$, we plan to stop ventilation.

- A valuation $\sigma : C \cup A \rightarrow \mathbb{B}$ can be used to assign a **truth value** to a propositional formula φ over $C \cup A$.
As usual, we write $\sigma \models \varphi$ iff φ evaluates to **true** under σ (and $\sigma \not\models \varphi$ otherwise).

- Rule formulae $\mathcal{F}(r)$ are propositional formulae over $C \cup A$
thus, given σ , we have either $\sigma \models \mathcal{F}(r)$ or $\sigma \not\models \mathcal{F}(r)$.

- Let σ be a model of an **observation** of C and A .

We say, σ is **allowed** by **decision table** T if and only if there exists a rule r in T such that $\sigma \models \mathcal{F}(r)$.

- 7 - 2017-05-19 - Software -

14/49

Example

T: room ventilation		r ₁	r ₂	r ₃
b	button pressed?	x	x	—
off	ventilation off?	x	—	*
on	ventilation on?	—	x	*
go	start ventilation	x	—	—
stop	stop ventilation	—	x	—

$$\mathcal{F}(r_1) = b \wedge \text{off} \wedge \neg \text{on} \wedge \text{go} \wedge \neg \text{stop}$$

$$\mathcal{F}(r_2) = b \wedge \neg \text{off} \wedge \text{on} \wedge \neg \text{go} \wedge \text{stop}$$

$$\mathcal{F}(r_3) = \neg b \wedge \text{true} \wedge \text{true} \wedge \neg \text{go} \wedge \neg \text{stop}$$

- (i) **Assume:** button pressed, ventilation off, we (only) plan to start the ventilation.

$$\sigma = \{ b \mapsto \text{true}, \text{off} \mapsto \text{true}, \text{on} \mapsto \text{false}, \text{go} \mapsto \text{true}, \text{stop} \mapsto \text{false} \}$$

$$\sigma \not\models \mathcal{F}(r_3)$$

$$\sigma \not\models \mathcal{F}(r_2)$$

$$\sigma \models \mathcal{F}(r_1) \checkmark$$

- 7 - 2017-05-19 - Software -

15/49

Example

T: room ventilation		r ₁	r ₂	r ₃
b	button pressed?	×	×	—
off	ventilation off?	×	—	*
on	ventilation on?	—	×	*
go	start ventilation	×	—	—
stop	stop ventilation	—	×	—

$$\mathcal{F}(r_1) = b \wedge \text{off} \wedge \neg \text{on} \wedge \text{go} \wedge \neg \text{stop}$$

$$\mathcal{F}(r_2) = b \wedge \neg \text{off} \wedge \text{on} \wedge \neg \text{go} \wedge \text{stop}$$

$$\mathcal{F}(r_3) = \neg b \wedge \text{true} \wedge \text{true} \wedge \neg \text{go} \wedge \neg \text{stop}$$

(i) **Assume:** button pressed, ventilation off, we (only) plan to start the ventilation.

- Corresponding valuation: $\sigma_1 = \{b \mapsto \text{true}, \text{off} \mapsto \text{true}, \text{on} \mapsto \text{false}, \text{start} \mapsto \text{true}, \text{stop} \mapsto \text{false}\}$.
- Is our intention (to start the ventilation now) **allowed** by T? **Yes!** (Because $\sigma_1 \models \mathcal{F}(r_1)$)

(ii) **Assume:** button pressed, ventilation on, we (only) plan to stop the ventilation.

- Corresponding valuation: $\sigma_2 = \{b \mapsto \text{true}, \text{off} \mapsto \text{false}, \text{on} \mapsto \text{true}, \text{start} \mapsto \text{false}, \text{stop} \mapsto \text{true}\}$.
- Is our intention (to stop the ventilation now) allowed by T? **Yes.** (Because $\sigma_2 \models \mathcal{F}(r_2)$)

(iii) **Assume:** button not pressed, ventilation on, we (only) plan to stop the ventilation.

- Corresponding valuation:
- Is our intention (to stop the ventilation now) allowed by T? **No!**

- 7 - 2017-05-19 - Semantics -

15/49

Decision Tables as Specification Language

- Decision Tables can be used to **objectively** describe desired software behaviour.

• **Example:** Dear developer, please provide a program such that

- in each situation (button pressed, ventilation on/off),
- whatever the software does (action start/stop)
- is **allowed** by decision table T.

T: room ventilation		r ₁	r ₂	r ₃
b	button pressed?	×	×	—
off	ventilation off?	×	—	*
on	ventilation on?	—	×	*
go	start ventilation	×	—	—
stop	stop ventilation	—	×	—

- 7 - 2017-05-19 - Semantics -

16/49

Decision Tables as Specification Language

- Decision Tables can be used to **objectively** describe desired software behaviour.
- Another Example:** Customer session at the bank:

T1: cash a cheque		r ₁	r ₂	else
c ₁	credit limit exceeded?	x	x	
c ₂	payment history ok?	x	—	
c ₃	overdraft < 500 €?	—	*	
a ₁	cash cheque	x	—	x
a ₂	do not cash cheque	—	x	—
a ₃	offer new conditions	x	—	—

(Balzert, 2009)

- clerk checks database state (yields σ for $c_1, \dots, c_3$),
- database says: credit limit exceeded over 500 €, but payment history ok,
- clerk cashes cheque but offers new conditions (according to T1).

16/49

Decision Tables as Specification Language

Requirements on Requirements Specifications

A **requirements specification** should be

- correct**
 - it correctly represents the wishes/needs of the customer.
- complete**
 - all requirements (existing in somebody's head, or a document, or ...) should be present.
- relevant**
 - things which are not relevant to the project should not be constrained.
- consistent, free of contradictions**
 - each requirement is compatible with all other requirements; otherwise the requirements are **not realisable**.
- neutral, abstract**
 - a requirements specification does not constrain the realisation more than necessary.
- traceable, comprehensible**
 - the sources of requirements are documented, requirements are uniquely identifiable.
- testable, objective**
 - the final product can **objectively** be checked for satisfying a requirement.
- Correctness and completeness** are defined **relative** to something which is usually only **in the customer's head**.
 - is **difficult to be sure of correctness and completeness**.

- "Dear customer, please tell me what is in your head!" is in almost all cases **not a solution!**

It's not unusual that even the customer does not precisely know...!

For example, the customer may not be aware of contradictions due to technical limitations.

12/37

16/49

Decision Tables for Requirements Analysis

Requirements on Requirements Specifications

A requirements specification should be

- **correct**
 - it correctly represents the wishes/needs of the customer.
 - **complete** ✓
 - all requirements (existing in somebody's head, or a document, or ...) should be present.
 - **relevant**
 - things which are not relevant to the project should not be constrained.
 - **consistent, free of contradictions** ✓
 - each requirement is compatible with all other requirements; otherwise the requirements are **not realisable**.
 - **neutral, abstract**
 - a requirements specification does not constrain the realisation more than necessary.
 - **traceable, comprehensible**
 - the sources of requirements are documented, requirements are uniquely identifiable.
 - **testable, objective** ✓
 - the final product can **objectively** be checked for satisfying a requirement.
- **Correctness** and **completeness** are defined **relative** to something which is usually only **in the customer's head**.
→ is is **difficult** to **be sure of correctness** and **completeness**.
- **"Dear customer, please tell me what is in your head!"** is in almost all cases **not a solution!**
It's not unusual that even the customer does not precisely know...!
For example, the customer may not be aware of contradictions due to technical limitations.

12/37

Completeness

Definition. [Completeness] A decision table T is called **complete** if and only if the disjunction of all rules' premises is a **tautology**, i.e. if

$$\models \bigvee_{r \in T} \mathcal{F}_{pre}(r).$$

Completeness: Example

T: room ventilation		r ₁	r ₂	r ₃
b	button pressed?	×	×	—
off	ventilation off?	×	—	*
on	ventilation on?	—	×	*
go	start ventilation	×	—	—
stop	stop ventilation	—	×	—

- Is T **complete**?

No. (Because there is no rule for, e.g., the case $\sigma(b) = \text{true}$, $\sigma(\text{on}) = \text{false}$, $\sigma(\text{off}) = \text{false}$).

$$b \wedge \text{off} \wedge \text{on} \not\Rightarrow \mathcal{F}_{pre}(r_1) \vee \mathcal{F}_{pre}(r_2) \vee \mathcal{F}_{pre}(r_3)$$

Recall:

$$\mathcal{F}(r_1) = c_1 \wedge c_2 \wedge \neg c_3 \wedge a_1 \wedge \neg a_2$$

$$\mathcal{F}(r_2) = c_1 \wedge \neg c_2 \wedge c_3 \wedge \neg a_1 \wedge a_2$$

$$\mathcal{F}(r_3) = \neg c_1 \wedge \text{true} \wedge \text{true} \wedge \neg a_1 \wedge \neg a_2$$

$$\begin{aligned} & \mathcal{F}_{pre}(r_1) \vee \mathcal{F}_{pre}(r_2) \vee \mathcal{F}_{pre}(r_3) \\ &= (c_1 \wedge c_2 \wedge \neg c_3) \vee (c_1 \wedge \neg c_2 \wedge c_3) \vee (\neg c_1 \wedge \text{true} \wedge \text{true}) \end{aligned}$$

is **not a tautology**.

- 7 - 2017-05-29 - Seminar -

21/49

Requirements Analysis with Decision Tables

- Assume we have formalised requirements as decision table T .
- If T is **(formally) incomplete**,
 - then there is probably a case not yet discussed with the customer, or some misunderstandings.
- If T is **(formally) complete**,
 - then there still may be misunderstandings.
 - If there are no misunderstandings, then we did discuss all cases.
- Note:**
 - Whether T is (formally) complete is **decidable**.
 - Deciding whether T is complete reduces to plain SAT.
 - There are efficient tools which decide SAT.
- In addition, decision tables are often much easier to understand than natural language text.

- 7 - 2017-05-29 - Seminar -

22/49

For Convenience: The 'else' Rule

- Syntax:

T: decision table		r_1	$\dots$	r_n	else
c_1	description of condition c_1	$v_{1,1}$	$\dots$	$v_{1,n}$	
$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$	
c_m	description of condition c_m	$v_{m,1}$	$\dots$	$v_{m,n}$	
a_1	description of action a_1	$w_{1,1}$	$\dots$	$w_{1,n}$	$w_{1,e}$
$\vdots$	$\vdots$	$\vdots$	$\ddots$	$\vdots$	$\vdots$
a_k	description of action a_k	$w_{k,1}$	$\dots$	$w_{k,n}$	$w_{k,e}$

- Semantics:

$$\mathcal{F}(\text{else}) := \neg \left(\bigvee_{r \in T \setminus \{\text{else}\}} \mathcal{F}_{pre}(r) \right) \wedge F(w_{1,e}, a_1) \wedge \dots \wedge F(w_{k,e}, a_k)$$

Proposition. If decision table T has an 'else'-rule, then T is complete.

23/49

Uselessness

Definition. [Uselessness] Let T be a decision table.

A rule $r \in T$ is called **useless** (or: **redundant**) if and only if there is another (different) rule $r' \in T$

- whose premise is implied by the one of r and
- whose effect is the same as r 's,

i.e. if

$$\exists r' \neq r \in T \bullet \models (\mathcal{F}_{pre}(r) \implies \mathcal{F}_{pre}(r')) \wedge (\mathcal{F}_{eff}(r) \iff \mathcal{F}_{eff}(r')).$$

r is called **subsumed** by r' .

- Again: uselessness is **decidable**; reduces to SAT.

24/49

Uselessness: Example

T: room ventilation		r_1	r_2	r_3	r_4
b	button pressed?	×	×	—	—
off	ventilation off?	×	—	*	—
on	ventilation on?	—	×	*	×
go	start ventilation	×	—	—	—
$stop$	stop ventilation	—	×	—	—

- Rule r_4 is **subsumed** by r_3 .
- Rule r_3 is **not** subsumed by r_4 .
- Useless rules “do not hurt” as such.
- Yet useless rules should be removed to make the table more readable, yielding an **easier usable** specification.

- 7 - 2017-05-29 - Selma -

25/49

Useless Requirements on Requirements Specification Documents

The **representation** and **form** of a requirements specification should be:

- **easily understandable**, **not unnecessarily complicated** – all affected people should be able to understand the requirements specification,
- **precise** – the requirements specification should not introduce new unclarities or rooms for interpretation (→ testable, objective),
- **easily maintainable** – creating and maintaining the requirements specification should be easy and should not need unnecessary effort,
- **easily usable** – storage of and access to the requirements specification should not need significant effort.

- Rule r_4 is **subsumed** by r_3 .
 - Rule r_3 is **not** subsumed by r_4 .
- Note:** Once again, it's about compromises.
- A very precise **objective** requirements specification may not be easily understandable by every affected person.
→ provide redundant explanations.
 - It is not trivial to have both, low maintenance effort and low access effort.
→ **value low access effort higher**, a requirements specification document is much more often **read** than **changed** or **written** (and most changes require reading beforehand).

- 4 - 2017-05-29 - Selma -

13/37

- 7 - 2017-05-29 - Selma -

25/49

Definition. [Determinism]

A decision table T is called **deterministic**

if and only if the premises of all rules are **pairwise disjoint**, i.e. if

$$\forall r_1 \neq r_2 \in T \bullet \models \neg(\mathcal{F}_{pre}(r_1) \wedge \mathcal{F}_{pre}(r_2)).$$

Otherwise, T is called **non-deterministic**.

- And again: determinism is **decidable**; reduces to SAT.

Determinism: Example

T: room ventilation		r_1	r_2	r_3
<i>b</i>	button pressed?	×	×	—
<i>off</i>	ventilation off?	×	—	*
<i>on</i>	ventilation on?	—	×	*
<i>go</i>	start ventilation	×	—	—
<i>stop</i>	stop ventilation	—	×	—

- Is T **deterministic**? **Yes.**

Determinism: Another Example

T_{abstr} : room ventilation		r_1	r_2	r_3
b	button pressed?	×	×	—
go	start ventilation	×	—	—
$stop$	stop ventilation	—	×	—

- Is T_{abstr} **deterministic**? **No**.

By the way...

- Is non-determinism **a bad thing** in general?
 - Just the opposite**: non-determinism is a very, very powerful **modelling tool**.
 - Read table T_{abstr} as:
 - the button** may switch the ventilation **on** **under certain conditions** (which I will specify later), and
 - the button** may switch the ventilation **off** **under certain conditions** (which I will specify later).
- We in particular state that we do not (under any condition) want to see *on* and *off* executed together, and that we do not (under any condition) see *go* or *stop* without button pressed.
- On the other hand: non-determinism may not be intended by the customer.

29/49

Domain Modelling for Decision Tables

-7-2017-05-29 - main -

30/49

Domain Modelling

Example:

T: room ventilation		r_1	r_2	r_3
b	button pressed?	×	×	—
off	ventilation off?	×	—	*
on	ventilation on?	—	×	*
go	start ventilation	×	—	—
$stop$	stop ventilation	—	×	—

- If on and off model opposite output values of **one and the same sensor** for “room ventilation on/off”, then $\sigma \models on \wedge off$ and $\sigma \models \neg on \wedge \neg off$ **never happen** in reality for any observation σ .
- Decision table T is incomplete for exactly these cases.
(T “does not know” that on and off can be opposites in the real-world).
- We should be able to “tell” T that on and off are opposites (if they are).
Then T would be **relative complete** (relative to the domain knowledge that on/off are opposites).

Bottom-line:

- Conditions and actions are **abstract entities** without inherent connection to the **real world**.
- When modelling **real-world aspects** by conditions and actions, we may also want to represent **relations between actions/conditions** in the real-world ($\rightarrow$ **domain model** (Björner, 2006)).

-7-2017-05-29 - Summary -

31/49

Conflict Axioms for Domain Modelling

- A **conflict axiom** over conditions C is a propositional formula φ_{conf} over C .

Intuition: a conflict axiom characterises all those cases,
i.e. all those combinations of condition values which 'cannot happen'
– according to our understanding of the domain.

- Note:** the decision table semantics remains unchanged!

Example:

- Let $\varphi_{conf} = (on \wedge off) \vee (\neg on \wedge \neg off)$.
“ on models an opposite of off , neither can both be satisfied nor both non-satisfied at a time”
- Notation:**

T: room ventilation		r ₁	r ₂	r ₃
b	button pressed?	x	x	—
off	ventilation off?	x	—	*
on	ventilation on?	—	x	*
go	start ventilation	x	—	—

Pitfalls in Domain Modelling (Wikipedia, 2015)

“Airbus A320-200 overran runway at Warsaw Okecie Intl. Airport on 14 Sep. 1993.”

- To stop a plane after touchdown, there are **spoilers** and **thrust-reverse systems**.
- Enabling one of those while in the air, can have **fatal consequences**.
- Design decision:** the **software should block** activation of spoilers or thrust-revers while in the air.
- Simplified decision table of **blocking** procedure:

T		r ₁	r ₂	r ₃	else
splq	spoilers requested	x	x	—	
thrq	thrust-reverse requested	—	—	x	
lgsw	at least 6.3 tons weight on each landing gear strut	x	*	x	
spd	wheels turning faster than 133 km/h	*	x	*	
spl	enable spoilers	x	x	—	—
thr	enable thrust-reverse	—	—	x	—

Idea: if conditions $lgsw$ and spd **not satisfied**, then aircraft is in the air.

14 Sep. 1993:

- wind conditions not as announced from tower, tail- and crosswinds,
- anti-crosswind manoeuvre puts **too little weight** on landing gear
- wheels didn't turn fast due to **hydroplaning**.

Definition. [Completeness wrt. Conflict Axiom]

A decision table T is called **complete wrt. conflict axiom** φ_{conf} if and only if the disjunction of all rules' premises and the conflict axiom is a **tautology**, i.e. if

$$\models \varphi_{conf} \vee \bigvee_{r \in T} \mathcal{F}_{pre}(r).$$

- **Intuition:** a relative complete decision table explicitly cares for all cases which 'may happen'.
- **Note:** with $\varphi_{conf} = \text{false}$, we obtain the previous definitions as a special case.
- **Fits intuition:** $\varphi_{conf} = \text{false}$ means we don't exclude any states from consideration.

Example

T: room ventilation		r ₁	r ₂	r ₃
b	button pressed?	×	×	—
off	ventilation off?	×	—	*
on	ventilation on?	—	×	*
go	start ventilation	×	—	—
stop	stop ventilation	—	×	—
$\neg[(on \wedge off) \vee (\neg on \wedge \neg off)]$				

- T is complete wrt. its conflict axiom.
- **Pitfall:** if *on* and *off* are outputs of **two different, independent sensors**, then $\sigma \models on \wedge off$ **is possible in reality** (e.g. due to sensor failures).
Decision table T does not tell us what to do in that case!

Definition. [Vacuity wrt. Conflict Axiom]

A rule $r \in T$ is called **vacuous wrt. conflict axiom** φ_{conf} if and only if the premise of r implies the conflict axiom, i.e. if $\models \mathcal{F}_{pre}(r) \rightarrow \varphi_{conf}$.

- **Intuition:** a vacuous rule would only be enabled in states which 'cannot happen'.

Example:

T : room ventilation		r_1	r_2	r_3	r_4
b	button pressed?	x	x	—	x
off	ventilation off?	x	—	*	x
on	ventilation on?	—	x	*	x
go	start ventilation	x	—	—	—
$stop$	stop ventilation	—	x	—	x
$\neg[(on \wedge off) \vee (\neg on \wedge \neg off)]$					

- **Vacuity wrt. φ_{conf} :** Like uselessness, vacuity **doesn't hurt as such** but
 - **May hint on inconsistencies on customer's side.** (Misunderstandings with conflict axiom?)
 - **Makes using the table less easy!** (Due to more rules.)
 - **Implementing vacuous rules is a waste of effort!**

Conflicting Actions

- 7 - 2017-05-29 - main -

38/49

Conflicting Actions

Definition. [Conflict Relation] A **conflict relation** on actions A is a **transitive** and **symmetric** relation $\zeta \subseteq (A \times A)$.

Definition. [Consistency] Let r be a rule of decision table T over C and A .

- (i) Rule r is called **consistent with conflict relation** ζ if and only if there are no conflicting actions in its effect, i.e. if

$$\models \mathcal{F}_{eff}(r) \rightarrow \bigwedge_{(a_1, a_2) \in \zeta} \neg(a_1 \wedge a_2).$$

- (ii) T is called **consistent** with ζ iff all rules $r \in T$ are **consistent** with ζ .

- 7 - 2017-05-29 - Summary -

- Again: consistency is **decidable**; reduces to SAT.

39/49

Example: Conflicting Actions

T: room ventilation		r ₁	r ₂	r ₃
b	button pressed?	x	x	—
off	ventilation off?	x	—	*
on	ventilation on?	—	x	*
go	start ventilation	(x)	—	—
stop	stop ventilation	(x)	x	—
$\neg[(on \wedge off) \vee (\neg on \wedge \neg off)]$				

- Let ζ be the transitive, symmetric closure of $\{(stop, go)\}$.
“actions *stop* and *go* are not supposed to be executed at the same time”
- Then rule r_1 is inconsistent with ζ .
- A decision table with **inconsistent** rules **may do harm in operation!**
- Detecting an inconsistency** only late during a project can incur significant cost!
- Inconsistencies** – in particular in (multiple) decision tables, created and edited by multiple people, as well as in requirements in general – are **not always as obvious** as in the toy examples given here! (would be too easy...)
- And is even less obvious with the **collecting semantics** ($\rightarrow$ in a minute).

A Collecting Semantics for Decision Tables

- 7 - 2017-05-29 - main -

42/49

Collecting Semantics

- Let T be a decision table over C and A
and σ be a model of an observation of C and A .

Then

$$\mathcal{F}_{coll}(T) := \bigwedge_{a \in A} a \leftrightarrow \bigvee_{r \in T, r(a) = \times} \mathcal{F}_{pre}(r)$$

is called **the collecting semantics** of T .

- 7 - 2017-05-29 - Sem08 -

43/49

Collecting Semantics

- Let T be a decision table over C and A
and σ be a model of an observation of C and A .

Then

$$\mathcal{F}_{coll}(T) := \bigwedge_{a \in A} a \leftrightarrow \bigvee_{r \in T, r(a)=\times} \mathcal{F}_{pre}(r)$$

is called **the collecting semantics** of T .

- We say, σ is **allowed** by T in **the collecting semantics** if and only if $\sigma \models \mathcal{F}_{coll}(T)$.
That is, if exactly **all actions** of **all enabled** rules are planned/exexcuted.

- 7 - 2017-05-29 - Sem08 -

43/49

Collecting Semantics

- Let T be a decision table over C and A
and σ be a model of an observation of C and A .

Then

$$\mathcal{F}_{coll}(T) := \bigwedge_{a \in A} a \leftrightarrow \bigvee_{r \in T, r(a)=\times} \mathcal{F}_{pre}(r)$$

is called **the collecting semantics** of T .

- We say, σ is **allowed** by T in **the collecting semantics** if and only if $\sigma \models \mathcal{F}_{coll}(T)$.
That is, if exactly **all actions** of **all enabled** rules are planned/exexcuted.

Example:

T: room ventilation		r ₁	r ₂	r ₃	r ₄
b	button pressed?	×	×	—	×
off	ventilation off?	×	—	*	*
on	ventilation on?	—	×	*	*
go	start ventilation	×	—	—	—
stop	stop ventilation	—	×	—	—
blnk	blink button	×	—	—	×
$\neg[(on \wedge off) \vee (\neg on \wedge \neg off)]$		—	—	—	—

→ go, blnk

- "Whenever the button is pressed, let it blink (in addition to go/stop action.)"

43/49

Definition. [Consistency in the Collecting Semantics]

Decision table T is called **consistent with conflict relation** $\not\vdash$ **in the collecting semantics** (under conflict axiom φ_{conf}) if and only if there are no conflicting actions in the effect of jointly enabled transitions, i.e. if

$$\models \mathcal{F}_{coll}(T) \wedge \varphi_{conf} \rightarrow \bigwedge_{(a_1, a_2) \in \not\vdash} \neg(a_1 \wedge a_2).$$

Discussion

“Es ist aussichtslos, den Klienten mit formalen Darstellungen zu kommen; [...]”
 (“It is futile to approach clients with formal representations”) (Ludewig and Lichter, 2013)

- ...of course it is – vast majority of customers is not trained in formal methods.
- formalisation is (first of all) for developers – analysts have to translate for customers.
- formalisation is the description of the analyst's understanding, in a most precise form.
Precise/objective: whoever reads it whenever to whomever, the meaning will not change.
- Recommendation: (Course's Manifesto?)
 - use formal methods for the most important/intricate requirements (formalising all requirements is in most cases not possible),
 - use the most appropriate formalism for a given task,
 - use formalisms that you know (really) well.

- 7 - 2017-05-19 - Summary -

46/49

Tell Them What You've Told Them. . .

- Decision Tables: one example for a formal requirements specification language with
 - formal syntax,
 - formal semantics.
- Requirements analysts can use DTs to
 - formally (objectively, precisely) describe their understanding of requirements. Customers may need translations/explanation!
- DT properties like
 - (relative) completeness, determinism,
 - uselessness,can be used to analyse requirements.
The discussed DT properties are decidable, there can be automatic analysis tools.
- Domain modelling formalises assumptions on the context of software; for DTs:
 - conflict axioms, conflict relation,Note: wrong assumptions can have serious consequences.
