Lecture 9: Live Sequence Charts

2017-06-19

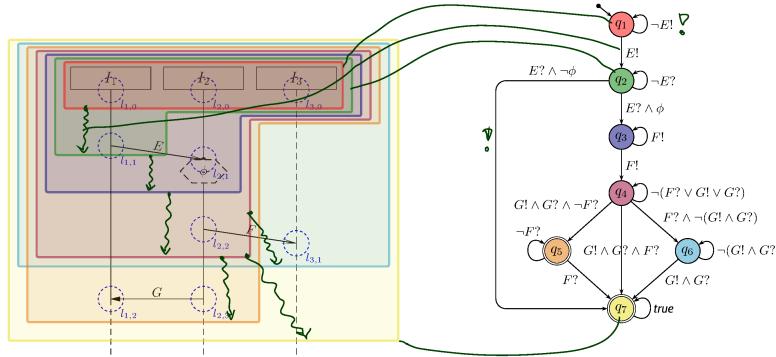

Prof. Dr. Andreas Podelski, **Dr. Bernd Westphal**

Albert-Ludwigs-Universität Freiburg, Germany

Topic Area Requirements Engineering: Content

Language of LSC Body: Example

The TBA $B(\mathcal{L})$ of LSC \mathcal{L} over \mathcal{C} and \mathcal{E} is $(\mathcal{C}_B, Q, q_{ini}, \rightarrow, Q_F)$ with

- $\mathcal{C}_B = \mathcal{C} \dot{\cup} \mathcal{E}_{!?}$, where $\mathcal{E}_{!?} = \{E!, E? \mid E \in \mathcal{E}\}$.
- Q is the set of cuts of \mathcal{L} , q_{ini} is the instance heads cut.
- \rightarrow consists of loops, progress transitions (from $\rightsquigarrow_{\mathcal{F}}$), and legal exits (cold cond./local inv.).
- $Q_F = \{C \in Q \mid \Theta(C) = \text{cold} \vee C = \mathcal{L}\}$ is the set of cold cuts and the maximal cut.

- **Methodology**
 - Requirements Engineering with scenarios
 - Strengthening scenarios into requirements
- **Requirements Engineering Wrap-Up**

- We would like to **precisely** and **objectively** specify the **allowed softwares** that make the customer happy.

- In other words, we want to formally define a **satisfies** relation between softwares and software specifications.

That is, given a software S and a software specification \mathcal{S} , we want to define when (and only when) software S **satisfies** software specification \mathcal{S} , denoted by

$$S \models \mathcal{S}.$$

- Once again:
 - $S \models \mathcal{S}$: specification is **satisfied**, S is one “allowed” design, should be accepted.
 - $S \not\models \mathcal{S}$: specification is **not satisfied**, S may not satisfy customer’s needs.

Software and Software Specification, formally

Definition. **Software** is a finite description S of a (possibly infinite) set $\llbracket S \rrbracket$ of (finite or infinite) **computation paths** of the form

$$\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \dots$$

where

- $\sigma_i \in \Sigma$, $i \in \mathbb{N}_0$, is called **state** (or **configuration**), and
- $\alpha_i \in A$, $i \in \mathbb{N}_0$, is called **action** (or **event**).

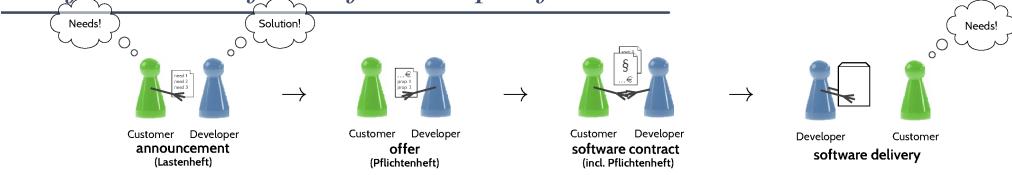

The (possibly partial) function $\llbracket \cdot \rrbracket : S \mapsto \llbracket S \rrbracket$ is called **interpretation** of S .

Definition. A **software specification** is a finite description \mathcal{S} of a (possibly infinite) set $\llbracket \mathcal{S} \rrbracket$ of softwares, i.e.

$$\llbracket \mathcal{S} \rrbracket = \{(S_1, \llbracket \cdot \rrbracket_1), (S_2, \llbracket \cdot \rrbracket_2), \dots\}.$$

The (possibly partial) function $\llbracket \cdot \rrbracket : \mathcal{S} \mapsto \llbracket \mathcal{S} \rrbracket$ is called **interpretation** of \mathcal{S} .

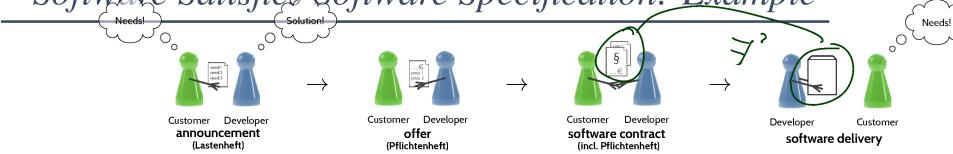

Software Satisfies Software Specification

Definition. Software $(S, \llbracket \cdot \rrbracket)$ **satisfies** software specification \mathcal{S} , denoted by $S \models \mathcal{S}$, if and only if

$$(S, \llbracket \cdot \rrbracket) \in \llbracket \mathcal{S} \rrbracket.$$

Software Satisfies Software Specification: Example

Software Specification

\mathcal{S} :

T : room ventilation		r_1	r_2	r_3
b	button pressed?	x	x	-
off	ventilation off?	x	-	*
on	ventilation on?	-	x	*
go	start ventilation	x	-	-
$stop$	stop ventilation	-	x	-

Define: $(S, \llbracket \cdot \rrbracket) \in \llbracket \mathcal{S} \rrbracket$ if and only if for all

$$\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \dots \in \llbracket S \rrbracket$$

and for all $i \in \mathbb{N}_0$,

$$\exists r \in T \bullet \sigma_i \models \mathcal{F}(r).$$

- Assume we have a program S for the room ventilation controller.
- Assume we can **observe** at well-defined points in time the conditions $b, off, on, go, stop$ when the software runs.
- Then the behaviour $\llbracket S \rrbracket$ of S can be viewed as computation paths of the form

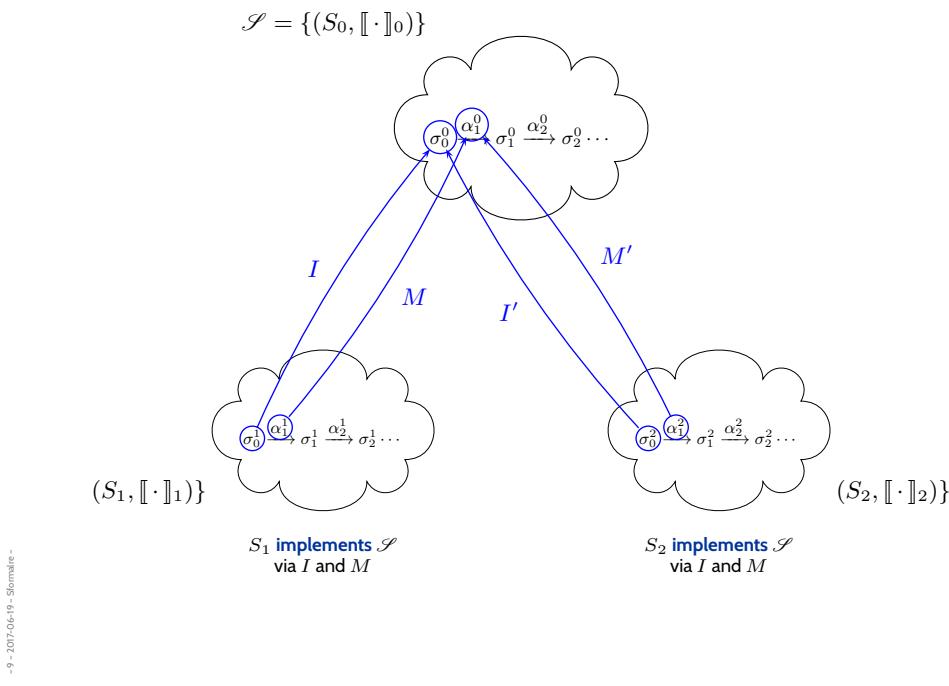

$$\sigma_0 \xrightarrow{\tau} \sigma_1 \xrightarrow{\tau} \sigma_2 \dots$$

where each σ_i is a valuation of $b, off, on, go, stop$, i.e. $\sigma_i : \{b, off, on, go, stop\} \rightarrow \mathbb{B}$.

- Assume there is $\sigma_0 \xrightarrow{\tau} \sigma_1 \dots \in \llbracket S \rrbracket$ with

$$\sigma_1 = \{b \mapsto 0, off \mapsto 1, on \mapsto 0, go \mapsto 1, stop \mapsto 0\}.$$

Software Specification vs. Software

9/54

Software Satisfies Software Specification: Another Example

Software Specification

Software

\mathcal{S} :

- Example positive **scenarios**
- Example negative **scenarios**
- Use Cases** with pre-condition

Define: $(S, \llbracket \cdot \rrbracket) \in \llbracket \mathcal{S} \rrbracket$ if and only if

- for each **positive** scenario, there is a corresponding $\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \dots \in \llbracket S \rrbracket$.
- for each **negative** scenario, there is no corresponding $\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \dots \in \llbracket S \rrbracket$.
- for each **use case** with pre-condition, if some σ_i satisfies the pre-condition, then

$$\sigma_i \xrightarrow{\alpha_{i+1}} \sigma_{i+1} \xrightarrow{\alpha_{i+2}} \dots$$

corresponds to the use case.

- Assume we can **observe** at well-defined points in time the observables relevant for the use cases when the software S runs.
- Then the behaviour $\llbracket S \rrbracket$ of S can be viewed as computation paths where each state σ_i is a valuation of the use cases' observables.
- And then we can relate S to \mathcal{S} .

- 9 - 2017-06-19 - Stormate -

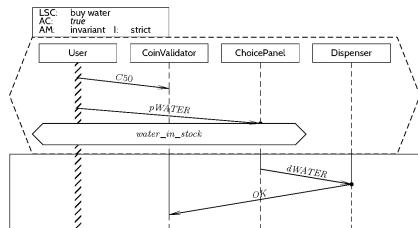

10/54

Software Satisfies Software Specification: Another Example

Software Specification

\mathcal{S} :

Define: $(S, \llbracket \cdot \rrbracket) \in \llbracket \mathcal{S} \rrbracket$ if and only if

- **tja...** (in a minute)

Software

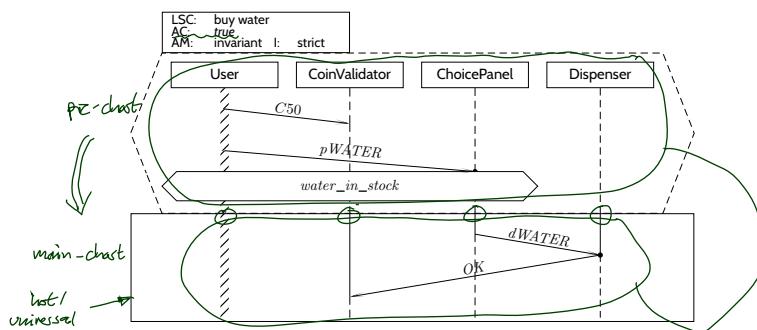

- Assume we can **observe** at well-defined points in time the observables relevant for the LSC (conditions and messages) when the software S runs.
- Then the **behaviour** $\llbracket S \rrbracket$ of S can be viewed as computation paths over the LSC's observables.
- And then we can relate S to \mathcal{S} .

LSC Semantics

Full LSC Syntax

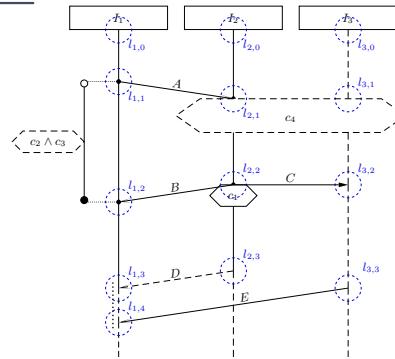

A full LSC $\mathcal{L} = (PC, MC, ac_0, am, \Theta_{\mathcal{L}})$ actually consist of

- **pre-chart** $PC = ((\mathcal{L}_P, \preceq_P, \sim_P), \mathcal{I}_P, \text{Msg}_P, \text{Cond}_P, \text{LocInv}_P, \Theta_P)$ (possibly empty).
- **main-chart** $MC = ((\mathcal{L}_M, \preceq_M, \sim_M), \mathcal{I}_M, \text{Msg}_M, \text{Cond}_M, \text{LocInv}_M, \Theta_M)$ (non-empty).
- **activation condition** $ac_0 \in \Phi(\mathcal{C})$.
- **strictness flag** $strict$ (if false, \mathcal{L} is **permissive**)
- **activation mode** $am \in \{\text{initial}, \text{invariant}\}$,
- **chart mode existential** ($\Theta_{\mathcal{L}} = \text{cold}$) or **universal** ($\Theta_{\mathcal{L}} = \text{hot}$).

From Concrete to Abstract Syntax

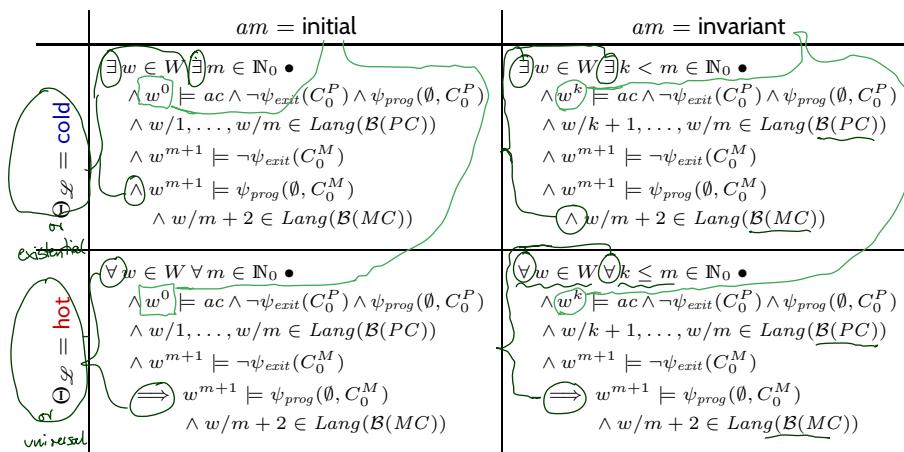

- locations \mathcal{L} ,
- $\preceq \subseteq \mathcal{L} \times \mathcal{L}$, $\sim \subseteq \mathcal{L} \times \mathcal{L}$
- $\mathcal{I} = \{I_1, \dots, I_n\}$,
- $\text{Msg} \subseteq \mathcal{L} \times \mathcal{E} \times \mathcal{L}$,
- $\text{Cond} \subseteq (2^{\mathcal{L}} \setminus \emptyset) \times \Phi(\mathcal{C})$
- $\text{LocInv} \subseteq \mathcal{L} \times \{\circ, \bullet\} \times \Phi(\mathcal{C}) \times \mathcal{L} \times \{\circ, \bullet\}$,
- $\Theta : \mathcal{L} \cup \text{Msg} \cup \text{Cond} \cup \text{LocInv} \rightarrow \{\text{hot}, \text{cold}\}$.

- $\mathcal{L} = \{l_{1,0}, l_{1,1}, l_{1,2}, l_{1,3}, l_{1,4}, l_{2,0}, l_{2,1}, l_{2,2}, l_{2,3}, l_{3,0}, l_{3,1}, l_{3,2}, l_{3,3}\}$
- $l_{1,0} \prec l_{1,1} \prec l_{1,2} \prec l_{1,3}, \quad l_{1,2} \prec l_{1,4}, \quad l_{2,0} \prec l_{2,1} \prec l_{2,2} \prec l_{2,3}, \quad l_{3,0} \prec l_{3,1} \prec l_{3,2} \prec l_{3,3},$
 $l_{1,1} \prec l_{2,1}, \quad l_{2,2} \prec l_{1,2}, \quad l_{2,3} \prec l_{1,3}, \quad l_{3,2} \prec l_{1,4}, \quad l_{2,1} \sim l_{3,1}, \quad l_{2,2} \sim l_{3,2},$
- $\mathcal{I} = \{\{l_{1,0}, l_{1,1}, l_{1,2}, l_{1,3}, l_{1,4}\}, \{l_{2,0}, l_{2,1}, l_{2,2}, l_{2,3}\}, \{l_{3,0}, l_{3,1}, l_{3,2}\}\}, \mathbb{Q}_3$
- $\text{Msg} = \{(l_{1,1}, A, l_{2,1}), (l_{2,2}, B, l_{1,2}), (l_{2,2}, C, l_{3,2}), (l_{2,3}, D, l_{1,3}), (l_{3,3}, E, l_{1,4})\}$
- $\text{Cond} = \{(\{l_{2,1}, l_{3,1}\}, c_4), (\{l_{2,2}\}, c_2 \wedge c_3)\}$
- $\text{LocInv} = \{(l_{1,1}, \circ, c_1, l_{1,2}, \bullet)\}$

32/46

LSC Semantics

- Here, W is a set of words (for the moment, think of computation paths, like $\llbracket S \rrbracket$).
- $w \in W$ is a word (for the moment, think of a computation path, like $\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \dots \in \llbracket S \rrbracket$).

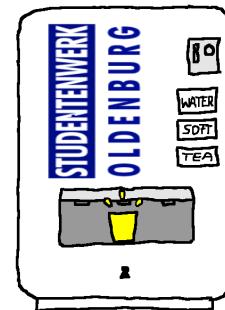

$\Theta_{\mathcal{L}}$ 	$\Theta_{\mathcal{L}}$

- 9 - 2017-06-19 - Spezchart -

- Here W is a set of words (for the moment, think of computation paths, like $\llbracket S \rrbracket$).
- $w \in W$ is a word (for the moment, think of a computation path, like $\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \dots \in \llbracket S \rrbracket$).

16/54

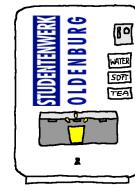

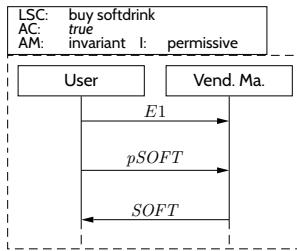

Example: Vending Machine

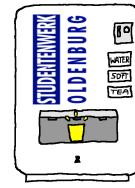

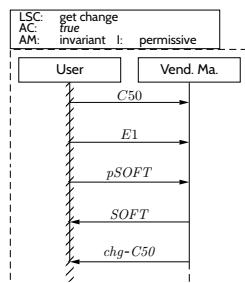

- **Positive scenario:** Buy a Softdrink
 - Insert one 1 euro coin.
 - Press the 'softdrink' button.
 - Get a softdrink.
- **Positive scenario:** Get Change
 - Insert one 50 cent and one 1 euro coin.
 - Press the 'softdrink' button.
 - Get a softdrink.
 - Get 50 cent change.
- **Negative scenario:** A Drink for Free
 - Insert one 1 euro coin.
 - Press the 'softdrink' button.
 - Do not insert any more money.
 - Get two softdrinks.

LSC Semantics: TBA Construction

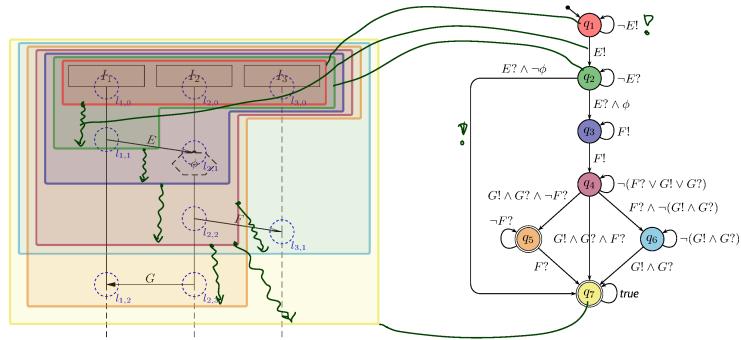

The Plan: A Formal Semantics for a Visual Formalism

$((\mathcal{L}, \preceq, \sim), \mathcal{I}, \text{Msg}, \text{Cond}, \text{LocInv}, \Theta)$
abstract syntax

Language of LSC Body: Example

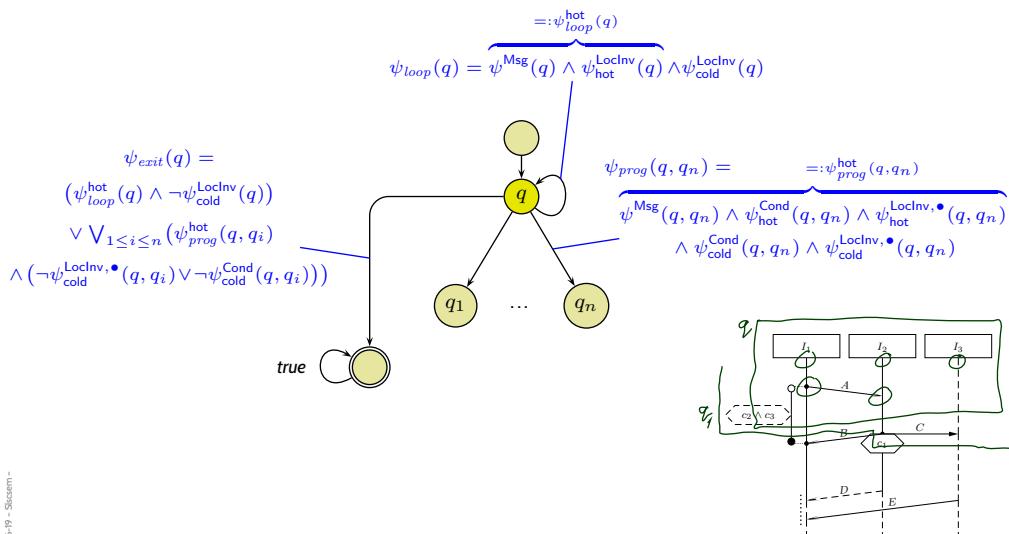

The TBA $\mathcal{B}(\mathcal{L})$ of LSC \mathcal{L} over \mathcal{C} and \mathcal{E} is $(\mathcal{C}_{\mathcal{B}}, Q, q_{ini}, \rightarrow, Q_F)$ with

- $\mathcal{C}_{\mathcal{B}} = \mathcal{C} \dot{\cup} \mathcal{E}_{!?}$, where $\mathcal{E}_{!?} = \{E!, E? \mid E \in \mathcal{E}\}$,
- Q is the set of cuts of \mathcal{L} , q_{ini} is the instance heads cut,
- \rightarrow consists of loops, progress transitions (from $\rightsquigarrow_{\mathcal{F}}$), and legal exits (cold cond./local inv.),
- $Q_F = \{C \in Q \mid \Theta(C) = \text{cold} \vee C = \mathcal{L}\}$ is the set of cold cuts and the maximal cut.

TBA Construction Principle

“Only” construct the transitions’ labels:

$$\rightarrow = \{(q, \psi_{loop}(q), q) \mid q \in Q\} \cup \{(q, \psi_{prog}(q, q'), q') \mid q \rightsquigarrow_{\mathcal{F}} q'\} \cup \{(q, \psi_{exit}(q), \mathcal{L}) \mid q \in Q\}$$

Loop Condition

$$\psi_{loop}(q) = \psi^{\text{Msg}}(q) \wedge \psi_{\text{hot}}^{\text{LocInv}}(q) \wedge \psi_{\text{cold}}^{\text{LocInv}}(q)$$

- $\psi^{\text{Msg}}(q) = \neg \bigvee_{1 \leq i \leq n} \psi^{\text{Msg}}(q, q_i) \wedge (\text{strict} \implies \underbrace{\bigwedge_{\psi \in \mathcal{E}_{!?} \cap \text{Msg}(\mathcal{L})} \neg \psi}_{=: \psi_{\text{strict}}(q)})$

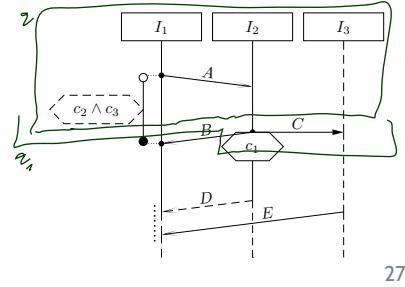

- $\psi_{\theta}^{\text{LocInv}}(q) = \bigwedge_{\ell=(l, \iota, \phi, l', \iota') \in \text{LocInv}, \Theta(\ell)=\theta, \ell \text{ active at } q} \phi$

A location l is called **front location** of cut C if and only if $\nexists l' \in \mathcal{L} \bullet l \prec l'$.

Local invariant $(l_0, \iota_0, \phi, l_1, \iota_1)$ is **active** at cut $(!) q$ if and only if $l_0 \preceq l \prec l_1$ for some front location l of cut q or $l = l_1 \wedge \iota_1 = \bullet$.

- $\text{Msg}(\mathcal{F}) = \{E! \mid (l, E, l') \in \text{Msg}, l \in \mathcal{F}\} \cup \{E? \mid (l, E, l') \in \text{Msg}, l' \in \mathcal{F}\}$

- $\text{Msg}(\mathcal{F}_1, \dots, \mathcal{F}_n) = \bigcup_{1 \leq i \leq n} \text{Msg}(\mathcal{F}_i)$

27/54

Progress Condition

$$\psi_{prog}^{\text{hot}}(q, q_i) = \psi^{\text{Msg}}(q, q_n) \wedge \psi_{\text{hot}}^{\text{Cond}}(q, q_n) \wedge \psi_{\text{hot}}^{\text{LocInv}, \bullet}(q_n)$$

- $\psi^{\text{Msg}}(q, q_i) = \bigwedge_{\psi \in \text{Msg}(q_i \setminus q)} \psi \wedge \bigwedge_{j \neq i} \bigwedge_{\psi \in (\text{Msg}(q_j \setminus q) \setminus \text{Msg}(q_i \setminus q))} \neg \psi$
 $\wedge (\text{strict} \implies \underbrace{\bigwedge_{\psi \in (\mathcal{E}_{!?} \cap \text{Msg}(\mathcal{L})) \setminus \text{Msg}(\mathcal{F}_i)} \neg \psi}_{=: \psi_{\text{strict}}(q, q_i)})$

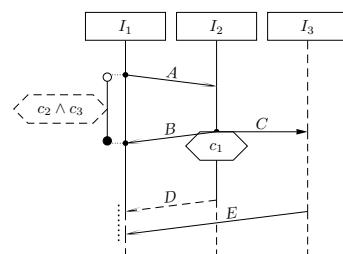

- $\psi_{\theta}^{\text{Cond}}(q, q_i) = \bigwedge_{\gamma=(L, \phi) \in \text{Cond}, \Theta(\gamma)=\theta, L \cap (q_i \setminus q) \neq \emptyset} \phi$

- $\psi_{\theta}^{\text{LocInv}, \bullet}(q, q_i) = \bigwedge_{\lambda=(l, \iota, \phi, l', \iota') \in \text{LocInv}, \Theta(\lambda)=\theta, \lambda \bullet\text{-active at } q_i} \phi$

Local invariant $(l_0, \iota_0, \phi, l_1, \iota_1)$ is **\bullet -active** at q if and only if

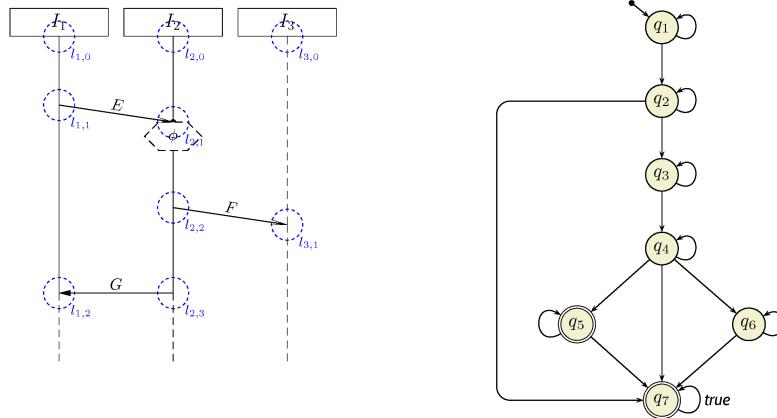

- $l_0 \prec l \prec l_1$, or
- $l = l_0 \wedge \iota_0 = \bullet$, or
- $l = l_1 \wedge \iota_1 = \bullet$

for some front location l of cut $(!) q$.

28/54

Example

Tell Them What You've Told Them...

- **Live Sequence Charts** (if well-formed)
 - have an abstract syntax.
- From an abstract syntax, mechanically construct its **TBA**.
- A **universal LSC** is **satisfied** by a software S if and only if
 - **all words** induced by the computation paths of S
 - are **accepted** by the LSC's TBA.
- An **existential LSC** is **satisfied** by a software S if and only if
 - **there is a word** induced by a computation path of S
 - which is **accepted** by the LSC's TBA.
- **Pre-charts** allow us to specify
 - anti-scenarios ("this must not happen"),
 - activation interactions.
