Tell Them What You've Told Them...

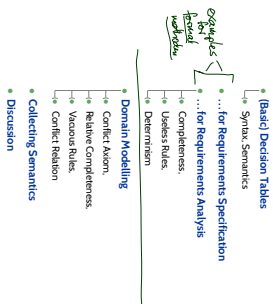

- Requirements Documents are **important** – e.g., for negotiation, design & implementation, documentation, testing, delivery for user, re-engineering, etc.
- A **Requirements Specification** should be **object (GOMS?) relevant, consistent, neutral, traceable, specific**
- Now: vague vs. abstract
- Requirements Representations should be
  - early understandable, precise, easily maintainable, easily usable
- Distinguish
  - hard vs. soft
  - pure vs. non-functional
  - open vs. **closed**
- It is the task of the analyst to **elicit** requirements.
- Natural language is inherently imprecise, counter-measures
  - natural language patterns
- Do not underestimate the value of a good dictionary.

(A Selection of) Analysis Techniques

8/10

## Decision Tables: Example

...

9/10

## Decision Table Syntax

- Let  $C$  be a set of conditions and  $A$  be a set of actions s.t.  $C \cap A = \emptyset$ .
- A decision table  $T$  over  $C$  and  $A$  is a labelled  $(m + k) \times n$  matrix

$T$ : decision table		$C$			$A$		
$c_1$	description of condition $c_1$	$c_2$	$c_3$	$c_4$	$a_1$	$a_2$	$a_3$
$c_1$	description of condition $c_1$	$w_{1,1}$	$w_{1,2}$	$w_{1,3}$	$w_{1,4}$	$w_{1,5}$	$w_{1,6}$
$c_2$	description of condition $c_2$	$w_{2,1}$	$w_{2,2}$	$w_{2,3}$	$w_{2,4}$	$w_{2,5}$	$w_{2,6}$
$c_3$	description of condition $c_3$	$w_{3,1}$	$w_{3,2}$	$w_{3,3}$	$w_{3,4}$	$w_{3,5}$	$w_{3,6}$
$c_4$	description of condition $c_4$	$w_{4,1}$	$w_{4,2}$	$w_{4,3}$	$w_{4,4}$	$w_{4,5}$	$w_{4,6}$

10/10

## Decision Table Syntax

$c_4$	description of condition $c_4$	$w_{4,1}$	$w_{4,2}$	$w_{4,3}$	$w_{4,4}$	$w_{4,5}$	$w_{4,6}$

...

10/10

## Decision Table Semantics

Each rule  $r \in \{r_1, \dots, r_m\}$  of table  $T$ 

$T$ : decision table		$C$			$A$		
$c_1$	description of condition $c_1$	$c_2$	$c_3$	$c_4$	$a_1$	$a_2$	$a_3$
$c_1$	description of condition $c_1$	$w_{1,1}$	$w_{1,2}$	$w_{1,3}$	$w_{1,4}$	$w_{1,5}$	$w_{1,6}$
$c_2$	description of condition $c_2$	$w_{2,1}$	$w_{2,2}$	$w_{2,3}$	$w_{2,4}$	$w_{2,5}$	$w_{2,6}$
$c_3$	description of condition $c_3$	$w_{3,1}$	$w_{3,2}$	$w_{3,3}$	$w_{3,4}$	$w_{3,5}$	$w_{3,6}$
$c_4$	description of condition $c_4$	$w_{4,1}$	$w_{4,2}$	$w_{4,3}$	$w_{4,4}$	$w_{4,5}$	$w_{4,6}$

is assigned to a **propositional logical formula**,  $\mathcal{F}(r)$  over signature  $C \cup A$  as follows:

- Let  $(c_1, \dots, c_m)$  and  $(a_1, \dots, a_n)$  be premise and effect of  $r$ .
- Then 
$$\mathcal{F}(r) := \underbrace{F(c_1, c_2) \wedge \dots \wedge F(c_m, c_m)}_{=p(r)} \wedge \underbrace{F(a_1, a_1) \wedge \dots \wedge F(a_n, a_n)}_{=e(r)}$$
- where 
$$F(v, x) := \begin{cases} x & \text{if } v = x \\ \neg x & \text{if } v = \neg x \\ \text{true} & \text{if } v = * \end{cases}$$

...

11/10

# Decision Table Semantics: Example

$$F(r) := F(r_1, a_1) \wedge \dots \wedge F(r_n, a_n) \\ \wedge F(r_1, a_1) \wedge \dots \wedge F(r_n, a_n)$$

$$F(r, s) = \begin{cases} \text{true} & \text{if } r = s \\ \text{false} & \text{if } r \neq s \end{cases}$$

$r$	$a_1$	$a_2$	$a_3$
$a_1$	x	x	x
$a_2$	x	x	x
$a_3$	x	x	x
$a_4$	x	x	x

- $F(r) = F(r, a_1) \wedge F(r, a_2) \wedge F(r, a_3) \wedge F(r, a_4) \wedge F(r, a_5)$
- $F(r_1) = a_1 \wedge a_2 \wedge a_3 \wedge a_4 \wedge a_5$
- $F(r_2) = a_1 \wedge a_2 \wedge a_3 \wedge a_4 \wedge a_5$
- $F(r_3) = a_1 \wedge a_2 \wedge a_3 \wedge a_4 \wedge a_5$

12.00

# Decision Tables as Requirements Specification

## Example

$r$	$a_1$	$a_2$	$a_3$
$a_1$	x	x	x
$a_2$	x	x	x
$a_3$	x	x	x
$a_4$	x	x	x

- $F(r_1) = a_1 \wedge a_2 \wedge a_3 \wedge a_4 \wedge a_5$
- $F(r_2) = a_1 \wedge a_2 \wedge a_3 \wedge a_4 \wedge a_5$
- $F(r_3) = a_1 \wedge a_2 \wedge a_3 \wedge a_4 \wedge a_5$

- Assume button pressed, ventilation off, we only plan to start the ventilation.
- $\sigma \vdash b \rightarrow true, a \rightarrow true, on \rightarrow false, stop \rightarrow false$
- $\sigma \vdash F(r_1)$
- $\sigma \vdash F(r_2)$
- $\sigma \vdash F(r_3)$

15.00

## Example

$r$	$a_1$	$a_2$	$a_3$
$a_1$	x	x	x
$a_2$	x	x	x
$a_3$	x	x	x
$a_4$	x	x	x

- $F(r_1) = a_1 \wedge a_2 \wedge a_3 \wedge a_4 \wedge a_5$
- $F(r_2) = a_1 \wedge a_2 \wedge a_3 \wedge a_4 \wedge a_5$
- $F(r_3) = a_1 \wedge a_2 \wedge a_3 \wedge a_4 \wedge a_5$

- Assume button pressed, ventilation off, we only plan to start the ventilation.
- Corresponding valuation  $\sigma \models (b \rightarrow true, on \rightarrow false, start \rightarrow true, stop \rightarrow false)$ .
- Is our intention to start the ventilation now? **allowed** by  $T$ ? Yes (Because  $\sigma \models F(r_1)$ )
- Assume button pressed, ventilation on, we only plan to stop the ventilation.
- Corresponding valuation  $\sigma \models (b \rightarrow true, off \rightarrow true, start \rightarrow false, stop \rightarrow true)$ .
- Is our intention to stop the ventilation now? **allowed** by  $T$ ? Yes (Because  $\sigma \models F(r_2)$ )
- Assume button not pressed, ventilation on, we only plan to stop the ventilation.
- Corresponding valuation.
- Is our intention to stop the ventilation now? **allowed** by  $T$ ? **No**

15.00

# Yes, And?

We can use decision tables to **model** (describe or prescribe) the behaviour of **software**

**Example:**  
Ventilation system of lecture hall 101-O-026.

$r$	$a_1$	$a_2$	$a_3$
$a_1$	x	x	x
$a_2$	x	x	x
$a_3$	x	x	x
$a_4$	x	x	x

- We can observe whether buttons is pressed and whether room ventilation is on or off.
- and whether we intend to start ventilation of stop ventilation.
- We can model our observation by a boolean valuation  $\sigma : C \cup A \rightarrow \{t, f\}$ , e.g. set  $\sigma(b) := true$  if button pressed now and  $\sigma(a) := false$  if button not pressed now.
- An evaluation  $\sigma : C \cup A \rightarrow \{t, f\}$  can be used to assign a truth value to a propositional formula  $\phi$  over  $C \cup A$ .
- As usual we write  $\sigma \models \phi$  iff  $\sigma$  evaluates to true under  $\sigma$  and  $\sigma \not\models \phi$  otherwise.
- Rule formulae  $F(r)$  are propositional formulae over  $C \cup A$ .
- Thus given  $\sigma$ , we have either  $\sigma \models F(r)$  or  $\sigma \not\models F(r)$ .
- Let  $\sigma$  be a model of an observation of  $C$  and  $A$ .
- We say  $\sigma$  is **allowed** by decision table  $T$  if and only if there exists a rule  $r$  in  $T$  such that  $\sigma \models F(r)$ .

14.00

## Decision Tables as Specification Language

- Decision Tables can be used to **objectively** describe desired software behaviour.
- Example:** Dear developer, please provide a program such that
  - in each situation button pressed, ventilation on/off,
  - whenever the software does action start/stop
- is **allowed** by decision table  $T$ .

$r$	$a_1$	$a_2$	$a_3$
$a_1$	x	x	x
$a_2$	x	x	x
$a_3$	x	x	x
$a_4$	x	x	x

16.00

Decision Tables can be used to **objectively** describe desired software behaviour.

Another Example: Customer session at the bank

T1: Cash Machine				
Condition	1	2	3	4
1.1. payment history ok	x	x	x	x
1.2. cardholder < 5000 €	x	x	x	x
1.3. do not cash cheque	x	x	x	x
1.4. offer new conditions	x	x	x	x
Result: 100%				

- click checks database state yields  $r$  for  $r_{1,1}, \dots, r_{1,4}$
- database says "credit limit exceeded over 500 €" so payment history ok.
- clerk catches cheque but offers new conditions (according to T1).

A requirements specification should be

- correct
  - somebody represents the wishes/needs of the customer
  - requirements existing in somebody's head or a document or ... should be present
  - things which are not relevant to the project should not be contained
- consistent
  - no contradictions
  - by all other requirements, otherwise the requirements are not reliable
- completeness and comprehensiveness are defined relative to something
  - it is difficult to be sure of correctness and completeness
  - "Dear customer, please tell me what is in your head" is in almost all cases not a solution!  
It's not unusual that even the customer does not precisely know. [...] For example, the customer may not be aware of considerations due to technical limitations.

mutual abstract

- a requirements specification does not contain the solution itself but necessary conditions for the solution

traceable, comprehensible

- the sources of requirements are documented

testable objective

- the requirements objectively be checked for validity by a requirement

## Decision Tables for Requirements Analysis

## Recall Once Again

Requirements on Requirements Specifications

A requirements specification should be

- correct
  - somebody represents the wishes/needs of the customer
  - requirements existing in somebody's head or a document or ... should be present
  - things which are not relevant to the project should not be contained
- consistent
  - no contradictions
  - by all other requirements, otherwise the requirements are not reliable
- completeness and comprehensiveness are defined relative to something
  - it is difficult to be sure of correctness and completeness
  - "Dear customer, please tell me what is in your head" is in almost all cases not a solution!  
It's not unusual that even the customer does not precisely know. [...] For example, the customer may not be aware of considerations due to technical limitations.

mutual abstract

- a requirements specification does not contain the solution itself but necessary conditions for the solution

traceable, comprehensible

- the sources of requirements are documented

testable objective

- the requirements objectively be checked for validity by a requirement

## Completeness

Definition. (Completeness) A decision table  $T$  is called complete if and only if the disjunction of all rules premises is a tautology, i.e. if

$$\models \bigvee_{r \in T} F_{pre}(r).$$

Definition (Determining)  
A decision table  $T$  is called **deterministic**  
if and only if the premises of all rules are pairwise disjoint, i.e. if  
$$\forall r_1 \neq r_2 \in T: \models \neg(\mathcal{F}_{pre}(r_1) \wedge \mathcal{F}_{pre}(r_2)).$$
  
Otherwise,  $T$  is called non-deterministic.

• And again determinism is **decidable**, reduces to SAT.

$T$ : room ventilation		$r_1$	$r_2$	$r_3$
$b$	button pressed?	x	x	—
$off$	ventilation off?	x	—	x
$on$	ventilation on?	—	x	x
$stop$	start ventilation	x	—	—
$stop$	stop ventilation	—	x	—

• Is  $T$  **deterministic**? **Yes.**

$T_{room}$ : room ventilation		$r_1$	$r_2$	$r_3$
$b$	button pressed?	x	x	—
$on$	start ventilation	x	—	—
$off/stop$	stop ventilation	—	x	—

• Is  $T_{room}$  **deterministic**? **No.**

By the way...

- Is non-determinism a **bad thing** in general?
- **Just the opposite**: non-determinism is a very very powerful **modelling tool**.

Bad table  $T_{door}$  OK

- the button may switch the ventilation **on**
- the button may switch the ventilation **off**
- the button may switch the ventilation **stop**

under certain conditions (which we specify later), and

under **certain conditions** (which we specify later).

We in particular state that we do not (under any condition) want to see  $on$  and  $off$  occurred together, and that we do not (under any condition) see  $on$  or  $off$  without button pressed.

- On the other hand: non-determinism may not be invented by the customer.

Logic

### Domain Modelling for Decision Tables

### Domain Modelling

#### Example:

$T$ : room ventilation		$r_1$	$r_2$	$r_3$
$b$	button pressed?	x	x	—
$off$	ventilation off?	x	—	x
$on$	start ventilation	—	x	x
$stop$	stop ventilation	x	—	—

- If  $on$  and  $off$  model opposite output values of one and the same sensor for "room ventilation on/off", then  $r_2 \models on \wedge off$  and  $r_3 \models on \wedge off$  never happen in reality for any observation  $\sigma$ .
  - Decision table  $T$  is incomplete for exactly these cases.
  - $T$  "does not know" that  $on$  and  $off$  can be opposites in the real-world.
  - We should be able to "tell"  $T$  that  $on$  and  $off$  are opposites (if they are).
- Then  $T$  would be **relative complete** (relative to the domain knowledge that  $on$  and  $off$  are opposites).
- Bottom-line:**
- Conditions and actions are **abstract entities** without inherent connection to the **real world**.
  - When modelling **real-world aspects** by conditions and actions, we may also want to represent **relations between actions/conditions** in the real-world ( $\rightarrow$  domain model (Figure 2.10.2)).

## Conflict Axioms for Domain Modelling

- A conflict axiom over conditions  $C$  is a propositional formula  $\varphi_{conf}$  over  $C$ .
- Intuition:** a conflict axiom characterizes all those cases, i.e. all those combinations of condition values which cannot happen – according to our understanding of the domain.
- Note: the decision table semantics remains unchanged!

### Example

- Let  $\varphi_{conf} = (on \wedge off) \vee (c-on \wedge \neg off)$ .
- "on" models an opposite of "off", neither can both be satisfied nor both non-satisfied at a time"

### Notation:

Conditionset		$c_1$	$c_2$	$c_3$
$C_1$	button pressed	x	x	x
$C_2$	switch on/off	x	x	x
$C_3$	door	x	x	x
$C_4$	start ventilation	x	x	x
$C_5$	stop ventilation	x	x	x

$\varphi_{conf} = (off \vee (c-on \wedge \neg off))$

32/40

## Pitfalls in Domain Modelling (Wikipedia, 2015)

### Airbus A320-200 overrun runway at Warsaw Chopin Int. Airport on 14 Sep. 1993

- To stop a plane after touchdown, there are **spoilers** and **thrust-reverser systems**.
- Ending one of those while in take-off can have **fatal consequences**.
- Design decision:** the software should block activation of spoilers or thrust-reverser while in the air.
- Simplified decision table of blocking procedure:

Decision		$c_1$	$c_2$	$c_3$	$c_4$	$c_5$
$C_1$	spoilers required	x	x	x	x	x
$C_2$	Make sure not to activate	x	x	x	x	x
$C_3$	Make sure not to activate	x	x	x	x	x
$C_4$	Wheel brake is down 30 hours	x	x	x	x	x
$C_5$	Wheel brake is down 30 hours	x	x	x	x	x
$C_6$	Wheel brake is down 30 hours	x	x	x	x	x
$C_7$	Wheel brake is down 30 hours	x	x	x	x	x
$C_8$	Wheel brake is down 30 hours	x	x	x	x	x
$C_9$	Wheel brake is down 30 hours	x	x	x	x	x
$C_{10}$	Wheel brake is down 30 hours	x	x	x	x	x
$C_{11}$	Wheel brake is down 30 hours	x	x	x	x	x
$C_{12}$	Wheel brake is down 30 hours	x	x	x	x	x
$C_{13}$	Wheel brake is down 30 hours	x	x	x	x	x

33/40

## Example

7' room ventilation		$c_1$	$c_2$	$c_3$	$c_4$
$C_1$	button pressed	x	x	x	x
$C_2$	switch on/off	x	x	x	x
$C_3$	start ventilation	x	x	x	x
$C_4$	stop ventilation	x	x	x	x

$\varphi_{conf} = (on \wedge off) \vee (c-on \wedge \neg off)$

- 7' is complete wrt. its conflict axiom.
- Pitfall:**  $c-on$  and  $off$  are outputs of two different independent sensors, therefore  $\models on \vee off$  is **possible in reality** (e.g. due to sensor failures). Decision table 7' does not tell us what to do in that case!

35/40

## Vacuity wrt. Conflict Axiom

**Definition (Weakly wrt. Conflict Axiom)**  
A rule  $r \in \mathcal{R}$  is called **vacuous wrt. conflict axiom**  $\varphi_{conf}$  if and only if the premise of  $r$  implies the conflict axiom, i.e. if  $\models_{F_{conf}(r)} r \rightarrow \varphi_{conf}$ .

- Intuition: a vacuous rule would only be enabled in states which cannot happen.

### Example:

7' room ventilation		$c_1$	$c_2$	$c_3$	$c_4$
$C_1$	button pressed	x	x	x	x
$C_2$	switch on/off	x	x	x	x
$C_3$	start ventilation	x	x	x	x
$C_4$	stop ventilation	x	x	x	x

$\varphi_{conf} = (on \wedge off) \vee (c-on \wedge \neg off)$

- Vacuity wrt.  $\varphi_{conf}$ :** Like uselessness, vacuity doesn't hurt as such but
- May hint on inconsistencies on customer's side. (Misunderstanding with conflict axiom)
- Makes using the table less easy! (Due to more rules)
- Implementing various rules is a waste of effort!

36/40

## Relative Completeness

**Definition (Completeness wrt. Conflict Axiom)**  
A decision table  $\mathcal{R}$  is called **complete wrt. conflict axiom**  $\varphi_{conf}$  if and only if the disjunction of all rules' premises and the conflict axiom is a tautology, i.e. if

$$\models \varphi_{conf} \vee \bigvee_{r \in \mathcal{R}} F_{pre}(r).$$

- Intuition: a relative complete decision table explicitly cares for all cases which may happen
- Note: with  $\varphi_{conf} = \text{false}$ , we obtain the previous definitions as a special case.

**Pre intuition:**  $\varphi_{conf} = \text{false}$  means we don't exclude any states from consideration.

Logic

Example: Conflicting Actions

Definition (Conflict Relation) A conflict relation on actions,  $A$ , is a **transitive and symmetric** relation  $\xi \subseteq (A \times A)$ .

Definition. (Consistency) Let  $r$  be a rule of decision table  $T$  over  $C$  and  $A$ .

f) Rule  $r$  is called **consistent with conflict relation  $\xi$**  if and only if there are no conflicting actions in its effect, i.e. if

$$\models \mathcal{F}_A(r) \rightarrow \bigwedge_{(a_1, a_2) \in \xi} \neg(a_1 \wedge a_2).$$

g)  $T$  is called **consistent with  $\xi$**  if all rules  $r \in T$  are consistent with  $\xi$ .

\* Agent consistency is **decidable**; reduces to SAT.

A Collecting Semantics for Decision Tables

T: Requirements Table		C <sub>1</sub> = {a, b, c}		C <sub>2</sub> = {a, b, c}	
id	table presented (action presented)	a	b	c	a
act	action set (action set)	+	+	+	+
act	start condition	+	+	+	+
act	stop condition	+	+	+	+
act	for (a, b) & (a, c) & (b, c)	+	+	+	+

T

- Let  $\xi$  be the transitive, symmetric closure of  $\{(a, b), (b, c)\}$ .
- actions  $a, b, c$  and  $g, c$  are not supposed to be executed at the same time
- Then rule  $r_1$  is inconsistent with  $\xi$ .

- A decision table with **inconsistent rules may do harm in operation!**
- **Detecting an inconsistency** only late during a project can incur significant cost!
- **Inconsistencies** – in particular in (multiple) decision tables, created and edited by multiple people, as well as in requirements in general – are **not always as obvious** as in the toy examples given here! (would be too easy.)
- And is even less obvious with the **collecting semantics** ( $\rightarrow$  in a minute).

Collecting Semantics

- Let  $T$  be a decision table over  $C$  and  $A$  and  $a$  be a model of an observation of  $C$  and  $A$ .
- Then
$$\mathcal{F}_{col}(T) := \bigwedge_{a \in A} a \leftrightarrow \bigvee_{c \in C} c(a) \times \mathcal{F}_{row}(c)$$
- is called the **collecting semantics** of  $T$ .

## Collecting Semantics

- Let  $T$  be a decision table over  $C$  and  $A$  and  $\sigma$  be a model of an observation of  $C$  and  $A$ .

Then

$$\mathcal{F}_{\text{col}}(C) := \bigvee_{a \in A} \bigvee_{c \in C} (c(a) = x \wedge \mathcal{F}_{\text{col}}(c))$$

is called the **collecting semantics** of  $T$ .

- We say  $\sigma$  is **allowed** by  $T$  in the **collecting semantics** if and only if  $\sigma \models \mathcal{F}_{\text{col}}(C)$ .

That is, if exactly **all actions** of **all enabled** rules are planned/executed

43/49

## Collecting Semantics

- Let  $T$  be a decision table over  $C$  and  $A$  and  $\sigma$  be a model of an observation of  $C$  and  $A$ .

Then

$$\mathcal{F}_{\text{col}}(C) := \bigvee_{a \in A} \bigvee_{c \in C} (c(a) = x \wedge \mathcal{F}_{\text{col}}(c))$$

is called the **collecting semantics** of  $T$ .

- We say  $\sigma$  is **allowed** by  $T$  in the **collecting semantics** if and only if  $\sigma \models \mathcal{F}_{\text{col}}(C)$ .

That is, if exactly **all actions** of **all enabled** rules are planned/executed

**Example**

action verification

- "Whenever the button is pressed, let it blink (in addition to go/stop action)"

43/49

## Speaking of Formal Methods

Es ist aussschlos, den Klienten mit formalen Darstellungen zu kommen. [J]

(It is a rule to approach clients with formal representations) (Juchling and Lehm, 2013)

- ... of course it is – vast majority of customers is not trained in formal methods.
- formalisation is first of all for developers – **analysts have to** translate for customers.
- formalisation is the description of the **analyst's understanding** in a most precise form.
- Precise/objective: whenever made it whenever the meaning will not change.
- Recommendation:** (Courte's Manifesto?)
- use formal methods for the **most important/riskiest requirements** (formalising all requirements is in most cases not possible).
- use the **most appropriate formalism** for a given task.
- use formalisms that **you know** (really) well.

46/49

## Consistency in the Collecting Semantics

**Definition:** (Consistency in the Collecting Semantics)  
Decision table  $T$  is called **consistent with conflict relation**  $\sharp$  in the **collecting semantics** (under conflict axiom  $\mathcal{F}_{\text{conf}}$ ) if and only if there are no conflicting actions in the effect of jointly enabled transitions, i.e. if

$$\models \mathcal{F}_{\text{col}}(T) \wedge \mathcal{F}_{\text{conf}} \rightarrow \bigwedge_{(a_1, a_2) \in \sharp} \neg (a_1 \wedge a_2)$$

44/49

## Tell Them What You've Told Them...

- Decision table** **can be used** for a **formal requirements specification** **only** with
  - formal syntax.
  - formal semantics.
  - Requirements analysts can use DTs to **formally** (objectively, precisely) describe **their understanding** of requirements. Customers may need translations/explanations!
- DT properties like
  - relative completeness, determinism, uniqueness.
  - can be used to **analyse** requirements.
  - The discussed DT properties are **decidable**, there can be **automatic** analysis tools.
- Domain modelling** formalises assumptions on the content of domain, i.e. DTs
  - conflict axioms, conflict relation.

Note: wrong assumptions can have serious consequences.

47/49

## Discussion
