From Abstract to Concrete Syntax

$$\mathcal{S} = (\mathcal{T}, \mathcal{C}, V, \text{atr}, F, \text{mth})$$

- $\mathcal{T} = \{\text{Int}, \text{Bool}\}$
- $\mathcal{C} = \{C, D\}$
- $V = \{x: \text{Int}, p: C_{0,1}, n: C_*\}$
- $\text{atr} = \{C \mapsto \{n, p\}, \{p, x\} D \mapsto \{x, p\}\}$
- $F = \{f: \text{Int} \rightarrow \text{Bool}, \dots\}$
- $\text{mth} = \{C \mapsto \emptyset, \dots, \text{get_x}\}$

-10-2019-06-17-Sunday-

31/61

-11-2019-06-24-main-

3/36

Basic Object System Structure Example

Wanted: a structure for signature

$$\mathcal{S}_0 = (\{\text{Int}, \text{Bool}\}, \{C, D\}, \{x: \text{Int}, p: C_{0,1}, n: C_*\}, \{C \mapsto \{p, n\}, D \mapsto \{p, x\}\}, \{f: \text{Int} \rightarrow \text{Bool}, \text{get_x}: \text{Int}\}, \{C \mapsto \emptyset, D \mapsto \{f, \text{get_x}\}\})$$

A structure \mathcal{D} maps

- $\tau \in \mathcal{T}$ to **some** $\mathcal{D}(\tau)$, $C \in \mathcal{C}$ to **some** identities $\mathcal{D}(C)$ (infinite, pairwise disjoint),
- C_* and $C_{0,1}$ for $C \in \mathcal{C}$ to $\mathcal{D}(C_{0,1}) = \mathcal{D}(C_*) = 2^{\mathcal{D}(C)}$.

$$\begin{aligned} \mathcal{D}(\text{Int}) &= \mathbb{Z} \\ \mathcal{D}(C) &= \mathbb{N} \times \{C\} = \{1_C, 2_C, 3_C, \dots\} \\ \mathcal{D}(D) &= \mathbb{N} \times \{D\} = \{1_D, 2_D, 3_D, \dots\} \\ \mathcal{D}(C_{0,1}) = \mathcal{D}(C_*) &= 2^{\mathcal{D}(C)} \\ \mathcal{D}(D_{0,1}) = \mathcal{D}(D_*) &= 2^{\mathcal{D}(D)} \end{aligned} \quad \left. \begin{array}{l} \mathcal{D}': \{3, 17, 25\} \\ \{0, \Delta, \Psi, \dots\} \\ \{a, aa, aaa, \dots\} \end{array} \right\}$$

-10-2019-06-17-Sunday-

40/61

-11-2019-06-24-main-

4/36

System State Examples

$$\begin{aligned} \mathcal{S}_0 = (&\{Int, Bool\}, \{C, D\}, \{x : Int, p : C_{0,1}, n : C_*\}, \{C \mapsto \{p, n\}, D \mapsto \{p, x\}\}, \\ &\{f : Int \rightarrow Bool, get_x : Int\}, \{C \mapsto \emptyset, D \mapsto \{f, get_x\}\}) \\ \mathcal{D}(Int) = &\mathbb{Z}, \quad \mathcal{D}(C) = \{1_C, 2_C, 3_C, \dots\}, \quad \mathcal{D}(D) = \{1_D, 2_D, 3_D, \dots\} \end{aligned}$$

A system state is a partial function $\sigma : \mathcal{D}(\mathcal{C}) \rightarrow (V \rightarrow (\mathcal{D}(\mathcal{T}) \cup \mathcal{D}(\mathcal{C}_*)))$ such that

- $\text{dom}(\sigma(u)) = \text{atr}(C)$,
- $\sigma(u)(v) \in \mathcal{D}(\tau)$ if $v : \tau, \tau \in \mathcal{T}$,
- $\sigma(u)(v) \in \mathcal{D}(C_*)$ if $v : D_*$ or $v : D_{0,1}$ with $D \in \mathcal{C}$.

$$\sigma_1 = \left\{ \begin{array}{l} 2_C \mapsto \{p \mapsto \{2_C\}, n \mapsto \emptyset\}, \\ 1_D \mapsto \{p \mapsto \{2_C\}, x \mapsto 23\} \end{array} \right\}$$

$$\sigma_2 = \emptyset$$

$$\sigma_3 = \left\{ 5_C \mapsto \{p \mapsto \{3_C\}, n \mapsto \emptyset\} \right\} \checkmark$$

Object Diagrams

$$\begin{aligned} \mathcal{S}_0 = (&\{Int, Bool\}, \{C, D\}, \{x : Int, p : C_{0,1}, n : C_*\}, \{C \mapsto \{p, n\}, D \mapsto \{p, x\}\}, \\ &\{f : Int \rightarrow Bool, get_x : Int\}, \{C \mapsto \emptyset, D \mapsto \{f, get_x\}\}), \quad \mathcal{D}(Int) = \mathbb{Z} \end{aligned}$$

$$\sigma = \{1_C \mapsto \{p \mapsto \emptyset, n \mapsto \{5_C\}\}, 5_C \mapsto \{p \mapsto \emptyset, n \mapsto \emptyset\}, 1_D \mapsto \{p \mapsto \{5_C\}, x \mapsto 23\}\}$$

- We may **represent** σ graphically as follows:

This is an **object diagram**.

- **Alternative notation:**

- **Alternative non-standard notation:**

Concrete Syntax:

 **Object Diagrams Cont'd**

- dangling references
- partial vs. complete
- object diagrams at work

• **Proto-OCL**

- syntax, semantics
- Proto-OCL vs. OCL
- Putting It All Together:
Proto-OCL vs. Software

Object Diagrams Cont'd

Special Case: Dangling Reference

Definition.

Let $\sigma \in \Sigma_{\mathcal{O}}$ be a system state and $u \in \text{dom}(\sigma)$ an alive object of class C in σ .

We say $r \in \text{atr}(C)$ is a **dangling reference** in u if and only if $r : C_{0,1}$ or $r : C_*$ and u refers to a **non-alive** object via r , i.e.

$$\langle \sigma(u) \rangle(r) \not\subseteq \text{dom}(\sigma).$$

Example:

- $\sigma = \{1_C \mapsto \{p \mapsto \emptyset, n \mapsto \{5_C\}\}, 1_D \mapsto \{p \mapsto \{5_C\}, x \mapsto 23\}\}$
- Object diagram representation:

- 11 - 2019-06-24 - SoSe11 -

9/36

Special Case: Anonymous Objects

If the object diagram

is considered as **complete**, then it denotes the set of all system states

$$\{1_C \mapsto \{p \mapsto \emptyset, n \mapsto \{c\}\}, \boxed{c} \mapsto \{p \mapsto \emptyset, n \mapsto \emptyset\}, \boxed{d} \mapsto \{p \mapsto \{c\}, x \mapsto 23\}\}$$

where $c \in \mathcal{D}(C)$, $d \in \mathcal{D}(D)$, $c \neq 1_C$.

Intuition: different boxes represent different objects.

Proto-OCL vs. Software

Towards Object Constraint Logic (OCL)
— “Proto-OCL” —

Motivation

- How do I **precisely, formally** tell **my developers** that

All D-instances having a link to the same C object must have links to the same A.

$x(a(d_1))$

- That is, the following system state is **forbidden** in the software:

Note: formally, it is a **proper system state**.

- Use **(Proto-)OCL**: "Dear developers, please only use system states which satisfy:"

$$\forall d_1 \in allInstances_D \bullet \forall d_2 \in allInstances_D \bullet c(d_1) = c(d_2) \implies a(d_1) = a(d_2)$$

-11-2019-06-24 - Spt-

Constraints on System States: Proto-OCL Syntax

- Example**: for all C-instances, x should never have the value 27.

C
x : Int

$$\forall c \in allInstances_C \bullet x(c) \neq 27$$

Definition. Proto-OCL Formulae wrt. signature $(\mathcal{I}, \mathcal{C}, V, atr, F, mth)$

(c is a **logical variable**, $C \in \mathcal{C}$):

$$\begin{array}{l}
 F ::= c \quad : \tau_C \\
 | allInstances_C \quad : 2^{\tau_C} \\
 | v(F) \quad : \tau_C \rightarrow \tau_{\perp}, \quad \text{if } v : \tau \in atr(C), \tau \in \mathcal{I} \\
 | v(F) \quad : \tau_C \rightarrow \tau_D, \quad \text{if } v : D_{0,1} \in atr(C) \\
 | v(F) \quad : \tau_C \rightarrow 2^{\tau_D}, \quad \text{if } v : D_* \in atr(C) \\
 | f(F_1, \dots, F_n) \quad : \tau_1 \times \dots \times \tau_n \rightarrow \tau, \quad \text{if } f : \tau_1 \times \dots \times \tau_n \rightarrow \tau \\
 | \forall c \in F_1 \bullet F_2 \quad : \tau_C \times 2^{\tau_C} \times \mathbb{B}_{\perp} \rightarrow \mathbb{B}_{\perp}
 \end{array}$$

- The formula above in **prefix normal form**: $\forall c \in allInstances_C \bullet \neq (x(c), 27)$

-11-2019-06-24 - Spt-

Semantics

- **Proto-OCL Types:**

- $\mathcal{I}[\tau_C] = \mathcal{D}(C) \cup \{\perp\}$, $\mathcal{I}[\tau_\perp] = \mathcal{D}(\tau) \cup \{\perp\}$, $\mathcal{I}[2^{\tau_C}] = \mathcal{D}(C_*) \cup \{\perp\}$
- $\mathcal{I}[\mathbb{B}_\perp] = \{true, false\} \cup \{\perp\}$, $\mathcal{I}[\mathbb{Z}_\perp] = \mathbb{Z} \cup \{\perp\}$

- **Functions:**

- We assume $f_{\mathcal{I}}$ given for each function symbol f (\rightarrow in a minute).

- **Proto-OCL Semantics** (interpretation function):

$$\mathcal{I}[\cdot](\cdot, \cdot) : \text{Proto-OCL-Formulae} \times \Sigma_{\mathcal{D}} \times B \rightarrow \{true, false, \perp\}$$

- $\mathcal{I}[c](\sigma, \beta) = \beta(c)$ (assuming β is a type-consistent valuation of the logical variables).
- $\mathcal{I}[allInstances_C](\sigma, \beta) = \text{dom}(\sigma) \cap \mathcal{D}(C)$.
- $\mathcal{I}[v(F)](\sigma, \beta) = \begin{cases} \sigma(\mathcal{I}[F](\sigma, \beta))(v) & , \text{if } \mathcal{I}[F](\sigma, \beta) \in \text{dom}(\sigma) \\ \perp & , \text{otherwise} \end{cases}$ (if not $v : C_{0,1}$)
- $\mathcal{I}[v(F)](\sigma, \beta) = \begin{cases} \underline{u'} & , \text{if } \mathcal{I}[F](\sigma, \beta) \in \text{dom}(\sigma) \text{ and } \sigma(\mathcal{I}[F](\sigma, \beta))(v) = \{u'\} \\ \perp & , \text{otherwise} \end{cases}$ (if $v : C_{0,1}$)
- $\mathcal{I}[f(F_1, \dots, F_n)](\sigma, \beta) = f_{\mathcal{I}}(\mathcal{I}[F_1](\sigma, \beta), \dots, \mathcal{I}[F_n](\sigma, \beta))$.
- $\mathcal{I}[\forall c \in F_1 \bullet F_2](\sigma, \beta) = \begin{cases} true & , \text{if } \mathcal{I}[F_2](\sigma, \beta[c := u]) = true \text{ for all } u \in \mathcal{I}[F_1](\sigma, \beta) \\ false & , \text{if } \mathcal{I}[F_2](\sigma, \beta[c := u]) = false \text{ for some } u \in \mathcal{I}[F_1](\sigma, \beta) \\ \perp & , \text{otherwise} \end{cases}$

-11-2019-06-24-5ed-

21/36

Semantics Cont'd

- Proto-OCL is a **three-valued** logic: a formula evaluates to *true*, *false*, or \perp .
- **Example:** $\wedge_{\mathcal{I}}(\cdot, \cdot) : \{true, false, \perp\} \times \{true, false, \perp\} \rightarrow \{true, false, \perp\}$ is defined as follows:

x_1	<i>true</i>	<i>true</i>	<i>true</i>	<i>false</i>	<i>false</i>	<i>false</i>	\perp	\perp	\perp
x_2	<i>true</i>	<i>false</i>	\perp	<i>true</i>	<i>false</i>	\perp	<i>true</i>	<i>false</i>	\perp
$\wedge_{\mathcal{I}}(x_1, x_2)$	<i>true</i>	<i>false</i>	\perp	<i>false</i>	<i>false</i>	<i>false</i>	\perp	<i>false</i>	\perp

We assume common logical connectives $\neg, \wedge, \vee, \dots$ with canonical 3-valued interpretation.

- **Example:** $+_{\mathcal{I}}(\cdot, \cdot) : (\mathbb{Z} \cup \{\perp\}) \times (\mathbb{Z} \cup \{\perp\}) \rightarrow \mathbb{Z} \cup \{\perp\}$

$$+_{\mathcal{I}}(x_1, x_2) = \begin{cases} x_1 + x_2 & , \text{if } x_1 \neq \perp \text{ and } x_2 \neq \perp \\ \perp & , \text{otherwise} \end{cases}$$

We assume common arithmetic operations $-, /, *, \dots$ and relation symbols $>, <, \leq, \dots$ with **monotone** 3-valued interpretation.

- And we assume the special unary function symbol *isUndefined*:

$$isUndefined_{\mathcal{I}}(x) = \begin{cases} true & , \text{if } x = \perp, \\ false & , \text{otherwise} \end{cases}$$

isUndefined _{\mathcal{I}} is **definite**: it never yields \perp .

-11-2019-06-24-5ed-

22/36

Example: Evaluate Formula for System State

$\sigma :$	<table style="border-collapse: collapse;"> <tr> <td style="border: none; padding-right: 5px;">1_C</td> <td style="border: none; padding-right: 5px;">C</td> </tr> <tr> <td style="border: none; padding-right: 5px;">$x = 13$</td> <td style="border: none;"></td> </tr> </table>	1_C	C	$x = 13$	
1_C	C				
$x = 13$					

C
$x : Int$

$$\forall c \in allInstances_C \bullet x(c) \neq 27$$

- Recall **prefix notation**: $\forall c \in allInstances_C \bullet \neq(x(c), 27)$

Note: \neq is a binary function symbol, 27 is a 0-ary function symbol.

- Example:**

$\mathcal{I}[\forall c \in allInstances_C \bullet \neq(x(c), 27)](\sigma, \emptyset) = true, \text{ because...}$

$\mathcal{I}[\neq(x(c), 27)](\sigma, \beta), \quad \beta := \emptyset[c := 1_C] = \{c \mapsto 1_C\}$

=

Example: Evaluate Formula for System State

$\sigma :$	<table style="border-collapse: collapse;"> <tr> <td style="border: none; padding-right: 5px;">1_C</td> <td style="border: none; padding-right: 5px;">C</td> </tr> <tr> <td style="border: none; padding-right: 5px;">$x = 13$</td> <td style="border: none;"></td> </tr> </table>	1_C	C	$x = 13$	
1_C	C				
$x = 13$					

C
$x : Int$

$$\forall c \in allInstances_C \bullet x(c) \neq 27$$

- Recall **prefix notation**: $\forall c \in allInstances_C \bullet \neq(x(c), 27)$

Note: \neq is a binary function symbol, 27 is a 0-ary function symbol.

- Example:**

$\mathcal{I}[\forall c \in allInstances_C \bullet \neq(x(c), 27)](\sigma, \emptyset) = true, \text{ because...}$

$\mathcal{I}[\neq(x(c), 27)](\sigma, \beta), \quad \beta := \emptyset[c := 1_C] = \{c \mapsto 1_C\}$

$= \neq_{\mathcal{I}}(\mathcal{I}[x(c)](\sigma, \beta), \mathcal{I}[27](\sigma, \beta))$

$= \neq_{\mathcal{I}}(\sigma(\mathcal{I}[c](\sigma, \beta))(x), 27_{\mathcal{I}})$

$= \neq_{\mathcal{I}}(\underbrace{\sigma(\beta(c))}_{\sigma(1_C)}(x), 27_{\mathcal{I}})$

$= \underbrace{(\sigma(1_C))}_{(x)}$

Example: Evaluate Formula for System State

- Recall **prefix notation**: $\forall c \in allInstances_C \bullet \neq(x(c), 27)$

Note: \neq is a binary function symbol, 27 is a 0-ary function symbol.

- Example:**

$\mathcal{I}[\forall c \in allInstances_C \bullet \neq(x(c), 27)](\sigma, \emptyset) = true$, because...

$\mathcal{I}[\neq(x(c), 27)](\sigma, \beta)$, $\beta := \emptyset[c := 1_C] = \{c \mapsto 1_C\}$

$= \neq_{\mathcal{I}}(\mathcal{I}[x(c)](\sigma, \beta), \mathcal{I}[27](\sigma, \beta))$

$= \neq_{\mathcal{I}}(\sigma(\mathcal{I}[c](\sigma, \beta)))(x), 27_{\mathcal{I}})$

$= \neq_{\mathcal{I}}(\sigma(\beta(c)))(x), 27_{\mathcal{I}})$

$= \neq_{\mathcal{I}}(\sigma(1_C))(x), 27_{\mathcal{I}})$

$= \neq_{\mathcal{I}}(13, 27) = true$...and 1_C is the only C -object in σ : $\mathcal{I}[allInstances_C](\sigma, \emptyset) = \{1_C\}$.

-11-2019-06-24-5ed-

23/36

More Interesting Example

- Similar to the previous slide, we need the value of

$\mathcal{I}[x(n(c))](\sigma, \beta)$, $\beta = \{c \mapsto 1_C\}$

- $\mathcal{I}[c](\sigma, \beta) = \beta(c) = 1_C$
- $\mathcal{I}[n(c)](\sigma, \beta) = \perp$ since $\sigma(\mathcal{I}[c](\sigma, \beta))(n) = \emptyset \neq \{u'\}$ by rule

$\mathcal{I}[v(F)](\sigma, \beta) = \begin{cases} u' & , \text{if } \mathcal{I}[F](\sigma, \beta) \in \text{dom}(\sigma) \text{ and } \sigma(\mathcal{I}[F](\sigma, \beta))(v) = \{u'\} \\ \perp & , \text{otherwise} \end{cases} \quad (\text{if } v : C_{0,1})$

- $\mathcal{I}[x(n(c))](\sigma, \beta) = \perp$ since $\mathcal{I}[n(c)](\sigma, \beta) = \perp$ by rule

$\mathcal{I}[v(F)](\sigma, \beta) = \begin{cases} \sigma(\mathcal{I}[F](\sigma, \beta))(v) & , \text{if } \mathcal{I}[F](\sigma, \beta) \in \text{dom}(\sigma) \\ \perp & , \text{otherwise} \end{cases} \quad (\text{if not } v : C_{0,1})$
--

-11-2019-06-24-5ed-

24/36

More Interesting Example

$$\forall c \in allInstances_C \bullet x(n(c)) \neq 27$$

- Similar to the previous slide, we need the value of

$$\mathcal{I}[x(n(c))](\sigma, \beta), \beta = \{c \mapsto 1_C\}$$

- $\mathcal{I}[c](\sigma, \beta) = \beta(c) = 1_C$
- $\mathcal{I}[n(c)](\sigma, \beta) = \perp$ since $\sigma(\mathcal{I}[c](\sigma, \beta))(n) = \emptyset \neq \{u'\}$ by rule

$$\mathcal{I}[v(F)](\sigma, \beta) = \begin{cases} u' & , \text{if } \mathcal{I}[F](\sigma, \beta) \in \text{dom}(\sigma) \text{ and } \sigma(\mathcal{I}[F](\sigma, \beta))(v) = \{u'\} \\ \perp & , \text{otherwise} \end{cases} \quad (\text{if } v : C_{0,1})$$

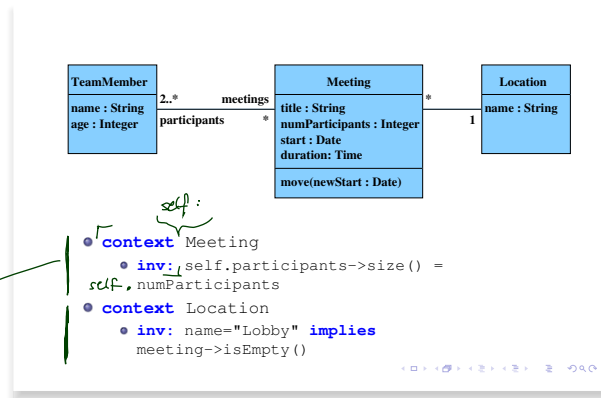

- $\mathcal{I}[x(n(c))](\sigma, \beta) = \perp$ since $\mathcal{I}[n(c)](\sigma, \beta) = \perp$ by rule

$$\mathcal{I}[v(F)](\sigma, \beta) = \begin{cases} \sigma(\mathcal{I}[F](\sigma, \beta))(v) & , \text{if } \mathcal{I}[F](\sigma, \beta) \in \text{dom}(\sigma) \\ \perp & , \text{otherwise} \end{cases} \quad (\text{if not } v : C_{0,1})$$

Object Constraint Language (OCL)

OCL is the same – just with less readable (?) syntax.

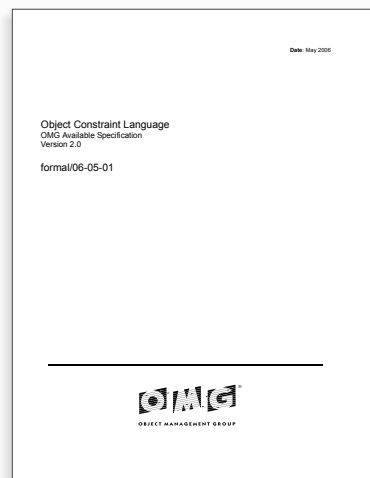

Literature: (OMG, 2006; Warmer and Kleppe, 1999).

Prof. Dr. P. Thiemann, <http://proglang.informatik.uni-leipzig.de/teaching/swt2/08.0/>

$\forall self \in \text{all instances Meeting}$ • $size(participants(self)) = numParticipants(self)$

Literature

Where To Put OCL Constraints?

- **Notes:** A UML **note** is a diagram element of the form

text can principally be **everything**, in particular **comments** and **constraints**.

Sometimes, content is **explicitly classified** for clarity:

- **Conventions:**

29/36

Putting It All Together

Modelling Structure with Class Diagrams

Definition. **Software** is a finite description S of a (possibly infinite) set $\llbracket S \rrbracket$ of (finite or infinite) **computation paths** of the form $\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \dots$ where

- $\sigma_i \in \Sigma$, $i \in \mathbb{N}_0$, is called **state** (or **configuration**), and
- $\alpha_i \in A$, $i \in \mathbb{N}_0$, is called **action** (or **event**).

The (possibly partial) function $\llbracket \cdot \rrbracket : S \mapsto \llbracket S \rrbracket$ is called **interpretation** of S .

- The set of **states** Σ could be the set of **system states** as defined by a class diagram, e.g.

- A corresponding **computation path** of a software S could be

- If a requirement is formalised by the Proto-OCL constraint

$$F = \forall c \in allInstances_{\mathcal{C}} \bullet x(c) < 4$$

then S **does not** satisfy the requirement.

More General: Software vs. Proto-OCL

- Let \mathcal{S} be an **object system signature** and \mathcal{D} a **structure**.
- Let S be a **software** with
 - states $\Sigma \subseteq \Sigma_{\mathcal{D}}$, and
 - **computation paths** $\llbracket S \rrbracket$.
- Let F be a Proto-OCL constraint over \mathcal{S} .
- We say $\llbracket S \rrbracket$ **satisfies** F , denoted by $\llbracket S \rrbracket \models F$, if and only if for all

$$\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \cdots \in \llbracket S \rrbracket$$
 and all $i \in \mathbb{N}_0$,

$$\mathcal{I}\llbracket F \rrbracket(\sigma_i, \emptyset) = \text{true}.$$
- We say $\llbracket S \rrbracket$ **does-not-satisfy** F , denoted by $\llbracket S \rrbracket \not\models F$, if and only if there exists

$$\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \cdots \in \llbracket S \rrbracket$$
 and $i \in \mathbb{N}_0$, such that $\mathcal{I}\llbracket F \rrbracket(\sigma_i, \emptyset) = \text{false}$.
- **Note:** $\neg(\llbracket S \rrbracket \not\models F)$ does not imply $\llbracket S \rrbracket \models F$.
