LSC Semantics: TBA Construction

LSC Semantics: It's in the Cuts!

Definition. Let $((\mathcal{L}, \preceq, \sim), \mathcal{I}, \text{Msg}, \text{Cond}, \text{LocInv}, \Theta)$ be an LSC body.

A non-empty set $\emptyset \neq C \subseteq \mathcal{L}$ is called a **cut** of the LSC body iff C

- is **downward closed**, i.e.

$$\forall l, l' \in \mathcal{L} \bullet l' \in C \wedge l \preceq l' \implies l \in C,$$

- is **closed** under **simultaneity**, i.e.

$$\forall l, l' \in \mathcal{L} \bullet l' \in C \wedge l \sim l' \implies l \in C, \text{ and}$$

- comprises at least **one location per instance line**, i.e.

$$\forall I \in \mathcal{I} \bullet C \cap I \neq \emptyset.$$

The temperature function is extended to cuts as follows:

$$\Theta(C) = \begin{cases} \text{hot} & \text{if } \exists l \in C \bullet (\nexists l' \in C \bullet l \prec l') \wedge \Theta(l) = \text{hot} \\ \text{cold} & \text{otherwise} \end{cases}$$

that is, C is **hot** if and only if at least one of its maximal elements is hot.

Cut Examples

$\emptyset \neq C \subseteq \mathcal{L}$ — downward closed — simultaneity closed — at least one loc. per instance line

Cut Examples

$\emptyset \neq C \subseteq \mathcal{L}$ — downward closed — simultaneity closed — at least one loc. per instance line

Cut Examples

$\emptyset \neq C \subseteq \mathcal{L}$ — downward closed — simultaneity closed — at least one loc. per instance line

A Successor Relation on Cuts

The partial order “ $\preceq$ ” and the simultaneity relation “ $\sim$ ” of locations induce a **direct successor relation** on cuts of an LSC body as follows:

Definition.

Let $C \subseteq \mathcal{L}$ be a cut of LSC body $((\mathcal{L}, \preceq, \sim), \mathcal{I}, \text{Msg}, \text{Cond}, \text{LocInv}, \Theta)$.

A set $\emptyset \neq \mathcal{F} \subseteq \mathcal{L}$ of locations is called **fired-set** $\mathcal{F}$ of cut C if and only if

- $C \cap \mathcal{F} = \emptyset$ and $C \cup \mathcal{F}$ is a cut, i.e. $\mathcal{F}$ is closed under simultaneity,
- all locations in $\mathcal{F}$ are **direct $\prec$ -successors** of the front of C , i.e.

$$\forall l \in \mathcal{F} \exists l' \in C \bullet l' \prec l \wedge (\nexists l'' \in \mathcal{L} \bullet l' \prec l'' \prec l),$$
- locations in $\mathcal{F}$ that lie on the same instance line are **pairwise unordered**, i.e.

$$\forall l \neq l' \in \mathcal{F} \bullet (\exists I \in \mathcal{I} \bullet \{l, l'\} \subseteq I) \implies l \not\prec l' \wedge l' \not\prec l,$$
- for each asynchronous message reception in $\mathcal{F}$,
the corresponding **sending is already in C** ,

$$\forall (l, E, l') \in \text{Msg} \bullet l' \in \mathcal{F} \implies l \in C.$$

The cut $C' = C \cup \mathcal{F}$ is called **direct successor of C via $\mathcal{F}$** , denoted by $C \rightsquigarrow_{\mathcal{F}} C'$.

Successor Cut Example

$C \cap \mathcal{F} = \emptyset$ — $C \cup \mathcal{F}$ is a cut — only direct $\prec$ -successors — same instance line on front pairwise unordered — sending of asynchronous reception already in

Successor Cut Example

$C \cap \mathcal{F} = \emptyset$ — $C \cup \mathcal{F}$ is a cut — only direct $\prec$ -successors — same instance line on front pairwise unordered — sending of asynchronous reception already in

Language of LSC Body: Example

Language of LSC Body: Example

The TBA $\mathcal{B}(\mathcal{L})$ of LSC $\mathcal{L}$ over $\mathcal{C}$ and $\mathcal{E}$ is $(\mathcal{C}_{\mathcal{B}}, Q, q_{ini}, \rightarrow, Q_F)$ with

- $\mathcal{C}_{\mathcal{B}} = \mathcal{C} \dot{\cup} \mathcal{E}_{!}^{\mathcal{I}}$, where $\mathcal{E}_{!}^{\mathcal{I}} = \{E_!^{i,j}, E_?^{i,j} \mid E \in \mathcal{E}, i, j \in \mathcal{I}\}$,
- Q is the set of cuts of $\mathcal{L}$, q_{ini} is the instance heads cut,
- $\rightarrow$ consists of loops, progress transitions (from $\rightsquigarrow_{\mathcal{F}}$), and legal exits (cold cond./local inv.),
- $Q_F = \{C \in Q \mid \Theta(C) = \text{cold} \vee C = \mathcal{L}\}$ is the set of cold cuts and the maximal cut.

TBA Construction Principle

Recall: The TBA $\mathcal{B}(\mathcal{L})$ of LSC $\mathcal{L}$ is $(\mathcal{C}, Q, q_{ini}, \rightarrow, Q_F)$ with

- Q is the **set of cuts** of $\mathcal{L}$, q_{ini} is the **instance heads** cut,
- $\mathcal{C}_{\mathcal{B}} = \mathcal{C} \cup \mathcal{E}_{!}^{\mathcal{I}}$,
- $\rightarrow$ consists of **loops**, **progress transitions** (from $\rightsquigarrow_{\mathcal{F}}$), and **legal exits** (cold cond./local inv.),
- $Q_F = \{C \in Q \mid \Theta(C) = \text{cold} \vee C = \mathcal{L}\}$ is the set of cold cuts.

So in the following, we “only” need to construct the transitions’ labels:

$$\rightarrow = \{(q, \underbrace{\psi_{loop}(q)}, q) \mid q \in Q\} \cup \{(q, \underbrace{\psi_{prog}(q, q')}, q') \mid q \rightsquigarrow_{\mathcal{F}} q'\} \cup \{(q, \underbrace{\psi_{exit}(q)}, \mathcal{L}) \mid q \in Q\}$$

TBA Construction Principle

“Only” construct the transitions’ labels:

$$\rightarrow = \{(q, \psi_{loop}(q), q) \mid q \in Q\} \cup \{(q, \psi_{prog}(q, q'), q') \mid q \rightsquigarrow_{\mathcal{F}} q'\} \cup \{(q, \psi_{exit}(q), \mathcal{L}) \mid q \in Q\}$$

Loop Condition

$$\psi_{loop}(q) = \psi^{Msg}(q) \wedge \psi_{hot}^{LocInv}(q) \wedge \psi_{cold}^{LocInv}(q)$$

$$\bullet \psi^{Msg}(q) = \neg \bigvee_{1 \leq i \leq n, \psi \in \text{Msg}(q_i \setminus q)} \psi \wedge \underbrace{\left(\text{strict} \implies \bigwedge_{\psi \in \mathcal{E}_{!}^I \cap \text{Msg}(\mathcal{L})} \neg \psi \right)}_{=: \psi_{strict}(q)}$$

$$\bullet \psi_{\theta}^{LocInv}(q) = \bigwedge_{\ell=(l, \iota, \phi, l', \iota') \in \text{LocInv}, \Theta(\ell)=\theta, \ell \text{ active at } q} \phi$$

A location l is called **front location** of cut C if and only if $\nexists l' \in C \bullet l \prec l'$.

Local invariant $(l_0, \iota_0, \phi, l_1, \iota_1)$ is **active** at cut (!) q

if and only if $l_0 \preceq l \prec l_1$ for some front location l of cut q or $l = l_1 \wedge \iota_1 = \bullet$.

$$\bullet \text{Msg}(\mathcal{F}) = \{E_!^{I(l), I(l')} \mid (l, E, l') \in \text{Msg}, l \in \mathcal{F}\} \cup \{E_?^{I(l), I(l')} \mid (l, E, l') \in \text{Msg}, l' \in \mathcal{F}\}$$

$$\bullet \text{Msg}(\mathcal{F}_1, \dots, \mathcal{F}_n) = \bigcup_{1 \leq i \leq n} \text{Msg}(\mathcal{F}_i)$$

Progress Condition

$$\psi_{prog}^{hot}(q, q_i) = \psi^{Msg}(q, q_n) \wedge \psi_{hot}^{Cond}(q, q_n) \wedge \psi_{hot}^{LocInv, \bullet}(q_n)$$

$$\begin{aligned} \bullet \quad \psi^{Msg}(q, q_i) = & \bigwedge_{\psi \in Msg(q_i \setminus q)} \psi \wedge \bigwedge_{j \neq i} \bigwedge_{\psi \in (Msg(q_j \setminus q) \setminus Msg(q_i \setminus q))} \neg \psi \\ & \wedge \underbrace{\left(strict \implies \bigwedge_{\psi \in (\mathcal{E}_1^I \cap Msg(\mathcal{L})) \setminus Msg(\mathcal{F}_i)} \neg \psi \right)}_{=: \psi_{strict}(q, q_i)} \end{aligned}$$

$$\bullet \quad \psi_{\theta}^{Cond}(q, q_i) = \bigwedge_{\gamma=(L, \phi) \in Cond, \Theta(\gamma)=\theta, L \cap (q_i \setminus q) \neq \emptyset} \phi$$

$$\bullet \quad \psi_{\theta}^{LocInv, \bullet}(q, q_i) = \bigwedge_{\lambda=(l, \iota, \phi, l', \iota') \in LocInv, \Theta(\lambda)=\theta, \lambda \text{ } \bullet\text{-active at } q_i} \phi$$

Local invariant $(l_0, \iota_0, \phi, l_1, \iota_1)$ is **•-active** at q if and only if

- $l_0 \prec l \prec l_1$, or
- $l = l_0 \wedge \iota_0 = \bullet$, or
- $l = l_1 \wedge \iota_1 = \bullet$

for some front location l of cut (!) q .

Büchi
infinite words

$w = 0101010101\dots$
 $L(B) = 0(10)^\omega$

$L(B') = ?$

symbolic

Definition. A **Symbolic Büchi Automaton** (TBA) is a tuple

$$\mathcal{B} = (\mathcal{C}_{\mathcal{B}}, Q, q_{ini}, \rightarrow, Q_F)$$

where

- $\mathcal{C}_{\mathcal{B}}$ is a set of atomic propositions,
- Q is a finite set of **states**,
- $q_{ini} \in Q$ is the initial state,
- $\rightarrow \subseteq Q \times \Phi(\mathcal{C}_{\mathcal{B}}) \times Q$ is the finite **transition relation**.

Each transitions $(q, \psi, q') \in \rightarrow$ from state q to state q' is labelled with a propositional formula $\psi \in \Phi(\mathcal{C}_{\mathcal{B}})$.

- $Q_F \subseteq Q$ is the set of **fair** (or accepting) states.

Example:

Definition. Let $\mathcal{B} = (\mathcal{C}_{\mathcal{B}}, Q, q_{ini}, \rightarrow, Q_F)$ be a TBA and

$$w = \sigma_1, \sigma_2, \sigma_3, \dots \in (\mathcal{C}_{\mathcal{B}} \rightarrow \mathbb{B})^\omega$$

an infinite word, each letter is a valuation of $\mathcal{C}_{\mathcal{B}}$.

An infinite sequence

$$\varrho = q_0, q_1, q_2, \dots \in Q^\omega$$

of states is called run of $\mathcal{B}$ over w if and only if

- $q_0 = q_{ini}$,
- for each $i \in \mathbb{N}_0$ there is a transition $(q_i, \psi_i, q_{i+1}) \in \rightarrow$ s.t. $\sigma_i \models \psi_i$.

Example:

$$w = \underbrace{\{a \mapsto \text{true}, b \mapsto \text{true}, c \mapsto \text{false}, d \mapsto \text{false}\}}_{\{a, b\} \text{ for short}}, \{c\}, \{a, b\}, (\{d\}, \{a, b\})^\omega$$

The Language of a TBA

Definition.

We say TBA $\mathcal{B} = (\mathcal{C}_{\mathcal{B}}, Q, q_{ini}, \rightarrow, Q_F)$ **accepts** the word

$$w = (\sigma_i)_{i \in \mathbb{N}_0} \in (\mathcal{C}_{\mathcal{B}} \rightarrow \mathbb{B})^\omega$$

if and only if $\mathcal{B}$ **has** a run

$$\varrho = (q_i)_{i \in \mathbb{N}_0}$$

over w

such that fair (or accepting) states are **visited infinitely often** by ϱ , i.e.,

$$\forall i \in \mathbb{N}_0 \exists j > i : q_j \in Q_F.$$

We call the set $Lang(\mathcal{B}) \subseteq (\mathcal{C}_{\mathcal{B}} \rightarrow \mathbb{B})^\omega$ of words that are accepted by $\mathcal{B}$ the **language of** $\mathcal{B}$.

Example:

LSCs vs. Software

Software, formally

Definition. Software is a finite description S of a (possibly infinite) set $\llbracket S \rrbracket$ of (finite or infinite) computation paths of the form

$$\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \cdots$$

where

- $\sigma_i \in \Sigma, i \in \mathbb{N}_0$, is called **state** (or **configuration**), and
- $\alpha_i \in A, i \in \mathbb{N}_0$, is called **action** (or **event**).

The (possibly partial) function $\llbracket \cdot \rrbracket : S \mapsto \llbracket S \rrbracket$ is called **interpretation** of S .

Software Specification, formally

Definition. A **software specification** is a finite description $\mathcal{S}$ of a (possibly infinite) set $\llbracket \mathcal{S} \rrbracket$ of softwares, i.e.

$$\llbracket \mathcal{S} \rrbracket = \{(S_1, \llbracket \cdot \rrbracket_1), (S_2, \llbracket \cdot \rrbracket_2), \dots\}.$$

The (possibly partial) function $\llbracket \cdot \rrbracket : \mathcal{S} \mapsto \llbracket \mathcal{S} \rrbracket$ is called **interpretation** of $\mathcal{S}$.

Definition. Software $(S, \llbracket \cdot \rrbracket)$ satisfies software specification $\mathcal{S}$, denoted by $S \models \mathcal{S}$, if and only if

$$(S, \llbracket \cdot \rrbracket) \in \llbracket \mathcal{S} \rrbracket.$$

Software Satisfies Software Specification: Example ?

Software Specification

$\mathcal{S}$:

T: room ventilation		r_1	r_2	r_3
b	button pressed?	×	×	—
off	ventilation off?	×	—	*
on	ventilation on?	—	×	*
go	start ventilation	×	—	—
$stop$	stop ventilation	—	×	—

Define: $(S, \llbracket \cdot \rrbracket) \in \llbracket \mathcal{S} \rrbracket$ if and only if for all

$$\sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \cdots \in \llbracket S \rrbracket$$

and for all $i \in \mathbb{N}_0$,

$$\exists r \in T \bullet \sigma_i \models \mathcal{F}(r).$$

Software

- Assume we have a program S for the room ventilation controller.
- Assume we can **observe** at well-defined points in time the conditions b , off , on , go , $stop$ when the software runs.
- Then **the behaviour** $\llbracket S \rrbracket$ of S can be viewed as computation paths of the form

$$\sigma_0 \xrightarrow{\tau} \sigma_1 \xrightarrow{\tau} \sigma_2 \cdots$$

where each σ_i is a valuation of b , off , on , go , $stop$, i.e. $\sigma_i : \{b, off, on, go, stop\} \rightarrow \mathbb{B}$.

- **For example:**

$$(off) \xrightarrow{\tau} \begin{pmatrix} b \\ off \\ go \end{pmatrix} \xrightarrow{\tau} (on) \xrightarrow{\tau} \begin{pmatrix} b \\ on \\ stop \end{pmatrix} \xrightarrow{\tau} (off) \cdots$$

Software Satisfies Software Specification: Another Example

Software Specification

$\mathcal{S}$:

Define: $(S, \llbracket \cdot \rrbracket) \in \llbracket \mathcal{S} \rrbracket$ if and only if

- **tja...** (in a minute)

Software

- Assume we can **observe** at well-defined points in time the observables relevant for the LSC (conditions and messages) when the software S runs.
- Then **the behaviour** $\llbracket S \rrbracket$ of S can be viewed as computation paths over the LSC's observables.
- **For example:**

- And then we can relate S to $\mathcal{S}$.

(Büchi automaton)

$\models$?

software

LSCs as Software Specification

A software S is called compatible with LSC $\mathcal{L}$ over $\mathcal{C}$ and $\mathcal{E}$ if and only if

- $\Sigma = (C \rightarrow \mathbb{B}), \mathcal{C} \subseteq C$, i.e. the **states** comprise valuations of the conditions in $\mathcal{C}$,
- $A = (B \rightarrow \mathbb{B}), \mathcal{E}_{! ?}^{\mathcal{I}} \subseteq B$, i.e. the **events** comprise valuations of $E_!^{i,j}, E_?^{i,j}$.

A computation path $\pi = \sigma_0 \xrightarrow{\alpha_1} \sigma_1 \xrightarrow{\alpha_2} \sigma_2 \cdots \in \llbracket S \rrbracket$ of software S **induces** the word

$$w(\pi) = (\sigma_0 \cup \alpha_1), (\sigma_1 \cup \alpha_2), (\sigma_2 \cup \alpha_3), \dots,$$

we use W_S to denote the set of words induced by $\llbracket S \rrbracket$, i.e.

$$W_S = \{w(\pi) \mid \pi \in \llbracket S \rrbracket\}.$$

LSCs vs. Software (or Systems)

$$w(\pi) = \{\}, \{E1\}, \{pSOFT\}, \{\}, \{\}, \{\}, \{SOFT\}, \{\}, \dots \in \mathcal{L}(\mathcal{A}_L) \\ \hookrightarrow \pi \models L$$

$$w = \{\}, \{E1_!^{U,V}, E1_?^{U,V}\}, \{pSOFT_!^{U,V}, pSOFT_?^{U,V}\}, \{\}, \{\}, \{\}, \{SOFT_!^{V,U}, SOFT_?^{V,U}\}, \{\}, \dots \\ \in \text{Lang}(\mathcal{B}(\mathcal{L}))$$

L :

$E1$: insert 1 € coin
 $pSOFT$: press 'SOFT' button
 $SOFT$: dispense soft drink

$\mathcal{A}_L$

TBA over $\mathcal{C}_B = \mathcal{C} \cup \mathcal{E}_{!?}^I$,
 where $\mathcal{C} = \emptyset$ and
 $\mathcal{E}_{!?}^I = \{E1_!^{U,V}, E1_?^{U,V}, pSOFT_!^{U,V}, pSOFT_?^{U,V}, SOFT_!^{V,U}, SOFT_?^{V,U}, \dots\}$.

LSCs vs. Software (or Systems)

$$\sigma_0 \xrightarrow{\tau} \sigma_1 \xrightarrow{E1^{U,V}} \sigma_2 \xrightarrow{pSOFT^{U,V}} \sigma_3 \xrightarrow{\tau} \sigma_4 \xrightarrow{\tau} \sigma_5 \xrightarrow{\tau} \sigma_6 \xrightarrow{SOFT^{V,U}} \dots \in \llbracket S \rrbracket$$

$$w(\pi) = \sigma_0, (\sigma_1 \cup \{E1_{!}^{U,V}, E1_{?}^{U,V}\}, (\sigma_2 \cup \{pSOFT_{!}^{U,V}, pSOFT_{?}^{U,V}\}, \sigma_3, \sigma_4, \sigma_5, (\sigma_6 \cup \{SOFT_{!}^{V,U}, SOFT_{?}^{V,U}\}, \dots$$

$$w = \{\}, \{E1_{!}^{U,V}, E1_{?}^{U,V}\}, \{pSOFT_{!}^{U,V}, pSOFT_{?}^{U,V}\}, \{\}, \{\}, \{\}, \{SOFT_{!}^{V,U}, SOFT_{?}^{V,U}\}, \{\}, \dots \in \text{Lang}(\mathcal{B}(\mathcal{L}))$$

E1: insert 1€ coin
pSOFT: press 'SOFT' button
SOFT: dispense soft drink

TBA over $\mathcal{C}_{\mathcal{B}} = \mathcal{C} \cup \mathcal{E}_{!?,?}^{\mathcal{I}}$,
 where $\mathcal{C} = \emptyset$ and
 $\mathcal{E}_{!?,?}^{\mathcal{I}} = \{E1_{!}^{U,V}, E1_{?}^{U,V}, pSOFT_{!}^{U,V}, pSOFT_{?}^{U,V}, SOFT_{!}^{V,U}, SOFT_{?}^{V,U}, \dots\}$.

Activation Condition and Mode

Full LSC Syntax (without pre-chart)

A **full LSC** $\mathcal{L} = (MC, ac_0, am, \Theta_{\mathcal{L}})$ consists of

- (non-empty) **main-chart** $MC = ((\mathcal{L}_M, \preceq_M, \sim_M), \mathcal{I}_M, \text{Msg}_M, \text{Cond}_M, \text{LocInv}_M, \Theta_M)$,
- **activation condition** $ac_0 \in \Phi(\mathcal{C})$,
- **strictness flag** *strict* (if *false*, $\mathcal{L}$ is **permissive**)
- **activation mode** $am \in \{\text{initial}, \text{invariant}\}$,
- **chart mode** **existential** ($\Theta_{\mathcal{L}} = \text{cold}$) or **universal** ($\Theta_{\mathcal{L}} = \text{hot}$).

Software Satisfies LSC

Let S be a software which is **compatible** with LSC $\mathcal{L}$ (without pre-chart).

We say software S **satisfies** LSC $\mathcal{L}$, denoted by $S \models \mathcal{L}$, if and only if

$\Theta_{\mathcal{L}}$	$am = \text{initial}$	$am = \text{invariant}$
cold	$\exists w \in W_S \bullet w^0 \models ac \wedge \neg \psi_{exit}(C_0)$ $\wedge w^0 \models \psi_{prog}(\emptyset, C_0) \wedge w/1 \in \text{Lang}(\mathcal{B}(\mathcal{L}))$	$\exists w \in W_S \exists k \in \mathbb{N}_0 \bullet w^k \models ac \wedge \neg \psi_{exit}(C_0)$ $\wedge w^k \models \psi_{prog}(\emptyset, C_0) \wedge w/k+1 \in \text{Lang}(\mathcal{B}(\mathcal{L}))$
hot	$\forall w \in W_S \bullet w^0 \models ac \wedge \neg \psi_{exit}(C_0)$ $\implies w^0 \models \psi_{prog}(\emptyset, C_0) \wedge w/1 \in \text{Lang}(\mathcal{B}(\mathcal{L}))$	$\forall w \in W_S \forall k \in \mathbb{N}_0 \bullet w^k \models ac \wedge \neg \psi_{exit}(C_0)$ $\implies w^k \models \psi_{hot}^{\text{Cond}}(\emptyset, C_0) \wedge w/k+1 \in \text{Lang}(\mathcal{B}(\mathcal{L}))$

where C_0 is the minimal (or **instance heads**) cut of the main-chart.

Software Satisfies LSC

Let S be a software which is **compatible** with LSC $\mathcal{L}$ (without pre-chart).

We say software S **satisfies** LSC $\mathcal{L}$, denoted by $S \models \mathcal{L}$, if and only if

$\Theta_{\mathcal{L}}$	$am = \text{initial}$	$am = \text{invariant}$
cold	$\exists w \in W_S \bullet w^0 \models ac \wedge \neg\psi_{exit}(C_0)$ $\wedge w^0 \models \psi_{prog}(\emptyset, C_0) \wedge w/1 \in \text{Lang}(\mathcal{B}(\mathcal{L}))$	$\exists w \in W_S \exists k \in \mathbb{N}_0 \bullet w^k \models ac \wedge \neg\psi_{exit}(C_0)$ $\wedge w^k \models \psi_{prog}(\emptyset, C_0) \wedge w/k+1 \in \text{Lang}(\mathcal{B}(\mathcal{L}))$
hot	$\forall w \in W_S \bullet w^0 \models ac \wedge \neg\psi_{exit}(C_0)$ $\implies w^0 \models \psi_{prog}(\emptyset, C_0) \wedge w/1 \in \text{Lang}(\mathcal{B}(\mathcal{L}))$	$\forall w \in W_S \forall k \in \mathbb{N}_0 \bullet w^k \models ac \wedge \neg\psi_{exit}(C_0)$ $\implies w^k \models \psi_{hot}^{\text{Cond}}(\emptyset, C_0) \wedge w/k+1 \in \text{Lang}(\mathcal{B}(\mathcal{L}))$

where C_0 is the minimal (or **instance heads**) cut of the main-chart.

Software S satisfies **a set of** LSCs $\mathcal{L}_1, \dots, \mathcal{L}_n$ if and only if $S \models \mathcal{L}_i$ for all $1 \leq i \leq n$.

LSCs At Work

Example: Vending Machine

- **Positive scenario:** Buy a Softdrink

We (only) accept the software if it **is possible** to buy a softdrink.

- (i) Insert one 1 euro coin.
- (ii) Press the 'softdrink' button.
- (iii) Get a softdrink.

- **Positive scenario:** Get Change

We (only) accept the software if it **is possible** to get change.

- (i) Insert one 50 cent and one 1 euro coin.
- (ii) Press the 'softdrink' button.
- (iii) Get a softdrink.
- (iv) Get 50 cent change.

- **Requirement:** Perform Self-Test on Power-on

We (only) accept the software if it **always** performs a self-test on power-on.

- (i) Check water dispenser.
- (ii) Check softdrink dispenser.
- (iii) Check tea dispenser.

(Slightly) Advanced LSC Topics

Full LSC Syntax (with pre-chart)

A **full LSC** $\mathcal{L} = (PC, MC, ac_0, am, \Theta_{\mathcal{L}})$ consists of

- **pre-chart** $PC = ((\mathcal{L}_P, \preceq_P, \sim_P), \mathcal{I}_P, \text{Msg}_P, \text{Cond}_P, \text{LocInv}_P, \Theta_P)$ (possibly empty),
- (non-empty) **main-chart** $MC = ((\mathcal{L}_M, \preceq_M, \sim_M), \mathcal{I}_M, \text{Msg}_M, \text{Cond}_M, \text{LocInv}_M, \Theta_M)$,
- **activation condition** $ac_0 \in \Phi(\mathcal{C})$,
- **strictness flag** *strict* (if *false*, $\mathcal{L}$ is **permissive**)
- **activation mode** $am \in \{\text{initial}, \text{invariant}\}$,
- **chart mode** **existential** ($\Theta_{\mathcal{L}} = \text{cold}$) or **universal** ($\Theta_{\mathcal{L}} = \text{hot}$).

LSC Semantics with Pre-chart

	$am = \text{initial}$	$am = \text{invariant}$
$\Theta_{\mathcal{L}} = \text{cold}$	$\exists w \in W \exists m \in \mathbb{N}_0 \bullet$ $\wedge w^0 \models ac \wedge \neg \psi_{exit}(C_0^P) \wedge \psi_{prog}(\emptyset, C_0^P)$ $\wedge w/1, \dots, w/m \in \text{Lang}(\mathcal{B}(PC))$ $\wedge w^{m+1} \models \neg \psi_{exit}(C_0^M)$ $\wedge w^{m+1} \models \psi_{prog}(\emptyset, C_0^M)$ $\wedge w/m + 2 \in \text{Lang}(\mathcal{B}(MC))$	$\exists w \in W \exists k < m \in \mathbb{N}_0 \bullet$ $\wedge w^k \models ac \wedge \neg \psi_{exit}(C_0^P) \wedge \psi_{prog}(\emptyset, C_0^P)$ $\wedge w/k + 1, \dots, w/m \in \text{Lang}(\mathcal{B}(PC))$ $\wedge w^{m+1} \models \neg \psi_{exit}(C_0^M)$ $\wedge w^{m+1} \models \psi_{prog}(\emptyset, C_0^M)$ $\wedge w/m + 2 \in \text{Lang}(\mathcal{B}(MC))$
$\Theta_{\mathcal{L}} = \text{hot}$	$\forall w \in W \forall m \in \mathbb{N}_0 \bullet$ $\wedge w^0 \models ac \wedge \neg \psi_{exit}(C_0^P) \wedge \psi_{prog}(\emptyset, C_0^P)$ $\wedge w/1, \dots, w/m \in \text{Lang}(\mathcal{B}(PC))$ $\wedge w^{m+1} \models \neg \psi_{exit}(C_0^M)$ $\implies w^{m+1} \models \psi_{prog}(\emptyset, C_0^M)$ $\wedge w/m + 2 \in \text{Lang}(\mathcal{B}(MC))$	$\forall w \in W \forall k \leq m \in \mathbb{N}_0 \bullet$ $\wedge w^k \models ac \wedge \neg \psi_{exit}(C_0^P) \wedge \psi_{prog}(\emptyset, C_0^P)$ $\wedge w/k + 1, \dots, w/m \in \text{Lang}(\mathcal{B}(PC))$ $\wedge w^{m+1} \models \neg \psi_{exit}(C_0^M)$ $\implies w^{m+1} \models \psi_{prog}(\emptyset, C_0^M)$ $\wedge w/m + 2 \in \text{Lang}(\mathcal{B}(MC))$

where C_0^P and C_0^M are the minimal (or **instance heads**) cuts of pre- and main-chart.

Pre-Charts At Work

Example: Vending Machine

Requirement: Buy Water

We (only) accept the software if,

- (i) **Whenever** we insert 0.50 €,
- (ii) and press the 'water' button (and no other button),
- (iii) and there is water in stock,
- (iv) **then** we get water (and nothing else).

Negative scenario: A Drink for Free

We **don't** accept the software if it is possible to get a drink for free.

- (i) Insert one 1 euro coin.
- (ii) Press the 'softdrink' button.
- (iii) Do not insert any more money.
- (iv) Get **two** softdrinks.

LSCs in Requirements Analysis

Requirements Engineering with Scenarios

One quite effective approach:

(i) **Approximate** the software requirements: ask for positive / negative **existential scenarios**.

- **Ask** the customer to describe **example usages** of the desired system.
In the sense of: **"If the system is not at all able to do this, then it's not what I want."**
(→ positive use-cases, existential LSC)
- **Ask** the customer to describe behaviour that **must not happen** in the desired system.
In the sense of: **"If the system does this, then it's not what I want."**
(→ negative use-cases, LSC with pre-chart and hot-*false*)

(ii) **Refine** result into **universal scenarios** (and validate them with customer).

- **Investigate** **preconditions**, **side-conditions**, **exceptional cases** and **corner-cases**.
(→ extend use-cases, refine LSCs with conditions or local invariants)
- **Generalise** into universal requirements, e.g., **universal LSCs**.
- **Validate** with customer using new positive / negative scenarios.

Strengthening Scenarios Into Requirements

Strengthening Scenarios Into Requirements

- Ask customer for (pos./neg.) scenarios, note down as existential LSCs:

- Strengthen into requirements, note down as universal LSCs:

- Re-Discuss with customer using example words of the LSCs' language.

LSCs vs. Quality Assurance

How to Prove that a Software Satisfies an LSC?

- Software S satisfies **existential** LSC $\mathcal{L}$ if there **exists** $\pi \in \llbracket S \rrbracket$ such that $\mathcal{L}$ accepts $w(\pi)$. Prove $S \models \mathcal{L}$ by demonstrating π .
- Note: **Existential** LSCs* may hint at **test-cases** for the **acceptance test!**
(*: as well as (positive) scenarios in general, like use-cases)

How to Prove that a Software Satisfies an LSC?

How to Prove that a Software Satisfies an LSC?

- Software S satisfies **existential** LSC $\mathcal{L}$ if there **exists** $\pi \in \llbracket S \rrbracket$ such that $\mathcal{L}$ accepts $w(\pi)$. Prove $S \models \mathcal{L}$ by demonstrating π .
- Note: **Existential** LSCs* may hint at **test-cases** for the **acceptance test!** (*: as well as (positive) scenarios in general, like use-cases)

- Universal** LSCs (and negative/anti-scenarios!) in general need an **exhaustive analysis!** (Because they require that the software **never ever** exhibits the unwanted behaviour.)
Prove $S \not\models \mathcal{L}$ by demonstrating one π such that $w(\pi)$ **is not accepted** by $\mathcal{L}$.

Pushing Things Even Further

(Harel and Marelly, 2003)

Tell Them What You've Told Them...

- **Live Sequence Charts** (if well-formed)
 - have an abstract syntax: instance lines, messages, conditions, local invariants; mode: hot or cold. ✓
- From an abstract syntax, ✓ mechanically construct its **TBA**.
- An **LSC** is **satisfied** by a software S if and only if
 - **existential** (cold):
 - **there is a word** induced by a computation path of S
 - which is **accepted** by the LSC's pre/main-chart TBA. ✓
 - **universal** (hot):
 - **all words** induced by the computation paths of S
 - are **accepted** by the LSC's pre/main-chart TBA. ✓
- **Pre-charts** allow us to
 - specify **anti-scenarios** ("this must not happen"), ✓
 - constrain **activation**. ✓
- **Method:**
 - discuss (anti-)scenarios with customer,
 - generalise into universal LSCs and re-validate. ✓

Vocabulary

Techniques

informal

semi-formal

formal

Risks Implied by Bad Requirements Specifications

design and implementation,

- without specification, programmers may just “ask around” when in doubt, possibly yielding different interpretations → **difficult integration**

negotiation

(with customer, marketing department, or ...)

preparation of tests,

- without a description of allowed outcomes, tests are randomly searching for generic errors (like crashes) → **systematic testing hardly possible**

acceptance by customer, resolving later objections or regress claims,

- without specification, it is unclear at delivery time whether behaviour is an error (developer needs to fix) or correct (customer needs to accept and pay) → **nasty disputes, additional effort**

documentation, e.g., the user's manual,

- without specification, the user's manual author can only describe what the system **does**, not what it should do (“**every observation is a feature**”)

re-use,

- without specification, re-use needs to be based on re-reading the code → **risk of unexpected changes**

later re-implementations.

- the new software may need to adhere to requirements of the old software; if not properly specified, the new software needs to be a 1:1 re-implementation of the old → **additional effort**

Requirements Analysis in a Nutshell

- Customers **may not know** what they want.
 - That's in general not their "fault"!
 - Care for **tacit** requirements.
 - Care for **non-functional** requirements / constraints.
- For **requirements elicitation**, consider starting with
 - **scenarios** ("positive use case") and **anti-scenarios** ("negative use case") and elaborate corner cases.

Thus, **use cases** can be **very useful** — use case **diagrams** not so much.
- Maintain a **dictionary** and high-quality descriptions.
- Care for **objectiveness** / **testability** early on.

Ask for each requirements: what is the **acceptance test**?
- **Use formal notations**
 - to **fully understand requirements** (precision),
 - for **requirements analysis** (completeness, etc.),
 - to communicate with your developers.
- If in doubt, **complement** (formal) **diagrams with text** (as safety precaution, e.g., in lawsuits).

Formalisation Validation

Two broad directions:

- **Option 1:** teach formalism (usually not economic).
- **Option 2:** serve as translator / mediator.

- ① domain experts **tell** system scenario S (maybe keep back, whether allowed / forbidden),
- ② FM expert **translates** system scenario to valuation σ ,
- ③ FM expert **evaluates** DT on σ ,
- ④ FM expert **translates** outcome to “allowed / forbidden by DT”,
- ⑤ compare expected outcome and real outcome.

• **Recommendation:** (Course's Manifesto?)

- use formal methods for the **most important/intricate requirements** (formalising **all requirements** is in most cases **not possible**),
- use the **most appropriate formalism** for a given task,
- use formalisms that **you know (really) well.**

(Strong) Literature Recommendation
