

Contents & Goals

Last Lecture:

- Basic Object System Signature \mathcal{S} and Structure \mathcal{D}

(Smells like they're related to class/object diagrams, officially we don't know yet...)

This Lecture:

- Educational Objectives: Capabilities for these tasks/questions:
 - Please explain this OCL constraint.
 - Please formalise this constraint in OCL.
 - Does this OCL constraint hold in this system state?
 - Can you think of a system state satisfying this constraint?
 - Please abbreviate all abbreviations in this OCL expression.
 - In what sense is OCL a three-valued logic? For what purpose?
 - How are $\mathcal{D}(C)$ and \mathcal{T}_C related?
- Content:
 - OCL Syntax, OCL Semantics over system states

Software Design, Modelling and Analysis in UML

Lecture 03: Object Constraint Language (OCL)

2013-10-28

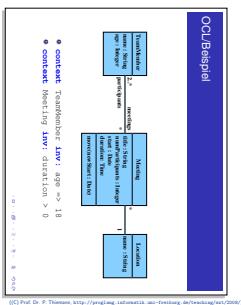

Prof. Dr. Andreas Pödlesi, Dr. Bernd Westphal
Albert-Ludwigs-Universität Freiburg, Germany

- 03 - 2013-10-28 - Svenhain -

What is OCL? And What is It Good For?

What is OCL? How Does it Look Like?

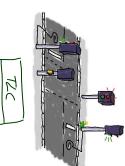

- OCL: Object Constraint Logic.

4.35

What's It Good For?

- Most prominent:** write down requirements supposed to be satisfied by all system states. Often targeting all alive objects of a certain class.

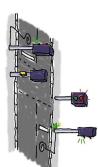

- 03 - 2013-10-28 - Svenhain -

2.35

What's It Good For?

- Most stringent:** write down requirements supposed to be satisfied by all system states. Often targeting all alive objects of a certain class.

- 03 - 2013-10-28 - main -

3.16

5.35

What's It Good For?

- **Not unknown:**
write down pre-/post-conditions of methods (Behavioral Features). Then evaluated over two system states.
- **Most prominent:**
written down requirements supposed to be satisfied by all system states. Often targeting all alive objects of a certain class.
- **Common with State Machines:**
guards in transitions.

5.39

What's It Good For?

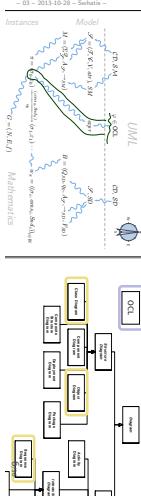

- **Lesser known:**
provide operation bodies.
- **Most promising:**
write down requirements supposed to be satisfied by all system states. Then evaluated over two system states.
- **Common with State Machines:**
UML models (cf. Lecture ~ 21).

5.39

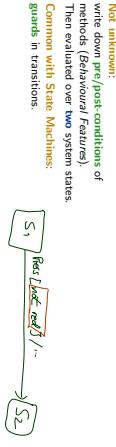

What's It Good For?

- **Today:**
 $\mathcal{I}(\mathcal{E}_\sigma, \sigma, \beta)$
The set $OCLExpressions(\mathcal{S})$ of OCL expressions over \mathcal{S} , methods (Behavioral Features), then evaluated over two system states, given an OCL expression \mathcal{E}_σ , a system state $\sigma \in \Sigma_\mathcal{S}$, and a valuation of logical variables β . Define $I[\mathcal{E}_\sigma](\alpha, \beta) \in \{\text{true}, \text{false}, \perp\}$.
- **Later:** use I to define $\vdash \subseteq \Sigma_\mathcal{S} \times OCLExpressions(\mathcal{S})$

- 03 - 2013-10-28 - main -

- **Not unknown:**
write down pre-/post-conditions of methods (Behavioral Features). Then evaluated over two system states.
- **Common with State Machines:**
Often targeting all alive objects of a certain class.

5.39

- **Not unknown:**
write down requirements supposed to be satisfied by all system states. Then evaluated over two system states.
- **Most prominent:**
written down requirements supposed to be satisfied by all system states.
- **Common with State Machines:**
Often targeting all alive objects of a certain class.

5.39

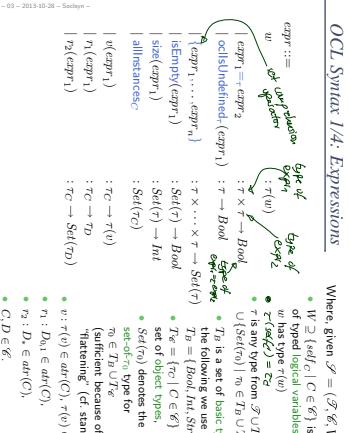

- **Not unknown:**
write down pre-/post-conditions of methods (Behavioral Features). Then evaluated over two system states.
- **Common with State Machines:**
Often targeting all alive objects of a certain class.

5.39

(Core) OCL Syntax [OMG, 2006]

OCL Syntax 1/4: Expressions

• T_B is set of basic types, in the following we use types: $T_B = \{\text{Bool}, \text{Int}, \text{String}\}$.

• T_E is $\{T \mid C \in \mathcal{C}\}$ is the following we use types: $T_E = \{Bool, Int, String\}$.

• T_D is $\{D \mid D \in \mathcal{D}\}$ is the following we use types: $T_D = \{Bool, Int, String\}$.

• T_R is $\{R \mid R \in \mathcal{R}\}$ is the following we use types: $T_R = \{Bool, Int, String\}$.

• T_M is $\{M \mid M \in \mathcal{M}\}$ is the following we use types: $T_M = \{Bool, Int, String\}$.

• $T_{\mathcal{L}}$ is $\{\mathcal{L} \mid \mathcal{L} \in \mathcal{L}\}$ is the following we use types: $T_{\mathcal{L}} = \{Bool, Int, String\}$.

• $T_{\mathcal{F}}$ is $\{\mathcal{F} \mid \mathcal{F} \in \mathcal{F}\}$ is the following we use types: $T_{\mathcal{F}} = \{Bool, Int, String\}$.

• $T_{\mathcal{C}}$ is $\{C \mid C \in \mathcal{C}\}$ is the following we use types: $T_{\mathcal{C}} = \{Bool, Int, String\}$.

• T_{attr} is $\{\mathit{attr} \mid \mathit{attr} \in \mathit{attr}(\mathcal{C})\}$ is the following we use types: $T_{\mathit{attr}} = \{Bool, Int, String\}$.

• T_{val} is $\{\mathit{val} \mid \mathit{val} \in \mathit{val}(\mathcal{C})\}$ is the following we use types: $T_{\mathit{val}} = \{Bool, Int, String\}$.

• T_{op} is $\{\mathit{op} \mid \mathit{op} \in \mathit{op}(\mathcal{C})\}$ is the following we use types: $T_{\mathit{op}} = \{Bool, Int, String\}$.

• T_{ctrl} is $\{\mathit{ctrl} \mid \mathit{ctrl} \in \mathit{ctrl}(\mathcal{C})\}$ is the following we use types: $T_{\mathit{ctrl}} = \{Bool, Int, String\}$.

• T_{func} is $\{\mathit{func} \mid \mathit{func} \in \mathit{func}(\mathcal{C})\}$ is the following we use types: $T_{\mathit{func}} = \{Bool, Int, String\}$.

• T_{query} is $\{\mathit{query} \mid \mathit{query} \in \mathit{query}(\mathcal{C})\}$ is the following we use types: $T_{\mathit{query}} = \{Bool, Int, String\}$.

• T_{state} is $\{\mathit{state} \mid \mathit{state} \in \mathit{state}(\mathcal{C})\}$ is the following we use types: $T_{\mathit{state}} = \{Bool, Int, String\}$.

• T_{feature} is $\{\mathit{feature} \mid \mathit{feature} \in \mathit{feature}(\mathcal{C})\}$ is the following we use types: $T_{\mathit{feature}} = \{Bool, Int, String\}$.

Where, given $\mathcal{S} = (\mathcal{F}, \mathcal{C}, V, \mathit{attr})$.

• $W \supseteq \{w \mid C \in \mathcal{C}\}$ is a set of typed logical variables,

• w has type $U \in \mathcal{U}$,

• $T_C(C) = T_{\mathcal{C}}$ is any type from $\mathcal{F} \cup T_D \cup T_E$.

• $occlUndefined(m) \mid m \in T_B \cup T_E$ is any type from $\mathcal{F} \cup T_D \cup T_E$.

• $\{expr_1, \dots, expr_n\} \mid n \in T_B \cup T_E$ is any type from $\mathcal{F} \cup T_D \cup T_E$.

• $isEmpy(expr_1)$ is any type from $\mathcal{F} \cup T_D \cup T_E$.

• $size(expr_1)$ is any type from $\mathcal{F} \cup T_D \cup T_E$.

• $allInstances<C>(expr_1)$ is any type from $\mathcal{F} \cup T_D \cup T_E$.

• $set(w)$ denotes the set- w -type for

• $\{x \mid x \in T_C\}$ is the set- T_C -type for

• $\{v \mid v \in T_{\mathit{val}}$

• $\{n \mid n \in T_{\mathit{int}}$

• $\{p \mid p \in T_{\mathit{op}}$

• $\{a \mid a \in T_{\mathit{ctrl}}$

• $\{\mathit{ctrl} \mid \mathit{ctrl} \in \mathit{ctrl}(\mathcal{C})\}$

8.39

- 03 - 2013-10-28 - main -

OCL Syntax: Notational Conventions for Expressions

- Each expression $\omega(\overbrace{expr_1, expr_2, \dots, expr_n}^{\text{here: only sets}}, \tau_1, \tau_2, \dots, \tau_n) : \tau_1 \times \dots \times \tau_n \rightarrow \tau$

may alternatively be written ("abbreviated as")

- $\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}} \rightarrow \omega(expr_1, \dots, expr_n)$ if τ_1 is an **object type**, i.e. if $\tau_1 \in T_E$.
- $\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}} \rightarrow \omega(expr_1, \dots, expr_n)$ if τ_1 is a **collection type** (here: only sets), i.e. if $\tau_1 = \text{Set}(\tau_0)$ for some $\tau_0 \in T_B \cup T_E$.
- **Examples:**
 - $(self : \tau_0 \in W; v, w : Int \in V; \tau_1 : D_A, \tau_2 : D_B \in V)$
 - $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Set}(\tau_1)$
 - $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Int}$
 - $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Object}$
 - $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Collection}$
- $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Boolean}$
- $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Bool} \times \text{Bool} \rightarrow \text{Bool}$
- $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Bool} \rightarrow \text{Bool}$
- $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Int}$
- $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Int} \times \text{Int} \rightarrow \text{Int}$
- $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Int} \times \text{Int} \rightarrow \text{Bool}$
- $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Int} \times \text{Int} \rightarrow \text{Bool}$
- $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Object}$
- $\omega(\overbrace{expr_1, \dots, expr_n}^{\text{here: only sets}}, \tau_1)$ $\vdash \text{Collection}$

9.9

OCL Syntax 2/4: Constants, Arithmetical Operators

For example:

$expr ::= \dots$	$\vdash \text{true}, \text{false}$	$\vdash \text{Bool}$
	$\vdash \text{expr}_1 \{ \text{and}, \text{or}, \text{implies} \} \text{expr}_2$	$\vdash \text{Bool} \times \text{Bool} \rightarrow \text{Bool}$
	$\vdash \text{not } \text{expr}_1$	$\vdash \text{Bool} \rightarrow \text{Bool}$
	$\vdash 0, -1, 1, -2, \dots$	$\vdash \text{Int}$
	$\vdash \text{OclUndefined}$	$\vdash \text{?}$
	$\vdash \text{expr}_1 \{ +, -, \dots \} \text{expr}_2$	$\vdash \text{Int} \times \text{Int} \rightarrow \text{Int}$
	$\vdash \text{expr}_1 \{ <, \leq, \dots \} \text{expr}_2$	$\vdash \text{Int} \times \text{Int} \rightarrow \text{Bool}$
	$\vdash self \star r_1 \star w$	$\vdash \text{self} \rightarrow \text{V}$
	$\vdash \text{expr}_1 \{ \text{size} \} \text{expr}_2$	$\vdash \text{Int} \times \text{Int} \rightarrow \text{Int}$
	$\vdash \text{expr}_1 \{ \text{isNotEmpty} \} \text{expr}_2$	$\vdash \text{isNotEmpty}(\text{expr}_1) \rightarrow \text{Bool}$
	$\vdash \text{expr}_1 \{ \text{size} \} \text{expr}_2$	$\vdash \text{isNotEmpty}(\text{expr}_1) \rightarrow \text{Int}$

9.9

OCL Syntax 3/4: Iterate

$$\mathcal{Y} = (\phi, \iota, \text{cds}, \overbrace{f_p, C_p, \iota^p, D_A, \delta, \text{if}, \text{for}, \text{do}}^{\text{forAll}}, \text{exists})$$

$$expr := \dots | \text{expr}_1 \rightarrow \text{iterate}(w_1 : \tau_1; res : \overbrace{w_2 = \text{O}, res \leftarrow \text{expr}_2}^{\text{set}}, \text{iter} : \tau_2)$$

where

- $expr$ is of **collection type** (here: a set $\text{Set}(\tau_0)$ for some τ_0)
- $iter \in W$ is called **Iterator**, gets type τ_1 (if τ_1 is omitted, τ_0 is assumed as type of $iter$)
- $result \in W$ is called **result variable**, gets type τ_2 (OclUndefined if omitted)
- $expr_2$ in an expression of type τ_2 giving the **initial value** for $result$, with $w \in \{+, -, \dots\}$
- $expr_3$ is an expression of type τ_2 in which in particular $iter$ and $result$ may appear.

10.9

OCL Syntax 4/4: Context

$$\mathcal{Y} = (\phi, \iota, \text{cds}, \overbrace{f_p, C_p, \iota^p, D_A, \delta, \text{if}, \text{for}, \text{do}}^{\text{forAll}}, \text{exists})$$

$$context ::= context \underbrace{w_1 : \tau_1, \dots, w_n : \tau_n}_{\text{where } w \in W \text{ and } \tau_i \in T_E, 1 \leq i \leq n, n \geq 0} \text{ inv } : \overbrace{expr}^{\text{expr}}$$

11.9

Iterate: Intuitive Semantics (Formally: iterate)

```
expr ::= expr_1 >|> iterate(iter : \tau_1;
                           result : \tau_2 = expr_2 | expr_3)
```

\downarrow pseudo code

```
Set(\tau_0) hlp = (expr_1);
\tau_1 iter;
\tau_2 result = (expr_2);
while (hlp.empty()) do
  pick one element
  iter = hlp.pop();
  result = (expr_3);
  eg. result += size(result, 2)
```

Note: In our (simplified) setting, we always have $\text{expr}_1 : \text{Set}(\tau_1)$ and $\tau_0 = \tau_1$. In the type hierarchy of full OCL with inheritance and oclAny, they may be different and still type consistent.

Abbreviations on Top of Iterate

```
expr ::= expr_1 >|> iterate(w_1 : \tau_1;
                           w_2 : \tau_2 = expr_2 | expr_3)
```

\downarrow is an abbreviation for $\text{expr}_1 \rightarrow \text{forAll}(w_1 : \tau_1) \text{expr}_3$
 $\text{expr}_1 \rightarrow \text{iterate}(w_1 : \tau_1; w_2 = \text{expr}_2 | \text{w1 and/or w3})$
(To ensure confusion, we may again omit all kinds of things cf [OMG, 2006]).

• Similar:

$\text{expr}_1 \rightarrow \text{Exists}(w : \tau_1 | \text{expr}_3)$

12.9

OCL Syntax 4/4: Context

```
context ::= context \underbrace{w_1 : \tau_1, \dots, w_n : \tau_n}_{\text{where } w \in W \text{ and } \tau_i \in T_E, 1 \leq i \leq n, n \geq 0} \text{ inv } : \overbrace{expr}^{\text{expr}}
```

\downarrow is an abbreviation for $\text{allInstances}_C \rightarrow \text{forAll}(w_1 : C_1 | \text{allInstances}_C \rightarrow \text{forAll}(w_2 : C_2 | \text{allInstances}_C \rightarrow \text{forAll}(w_n : C_n | \text{expr}))$

In the type hierarchy of full OCL with inheritance and oclAny, they may be different and still type consistent.

13.9

Context: More Notational Conventions

- For

context $\text{self} : \tau_c \text{ inv : expr}$

we may alternatively write ("abbreviate as")

context $\tau_c \text{ inv : expr}$

e.g. context $\mathcal{C}, \text{inv : expr}$

- Within the latter abbreviation, we may omit the " self " in expr , i.e. for

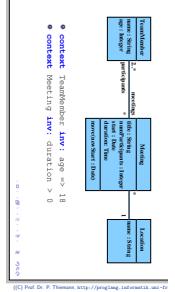

$\text{self}^{\text{?}}$ and self^r

we may alternatively write ("abbreviate as")

$\text{self}^{\text{?}}$ and r

15.9

Examples (from lecture)

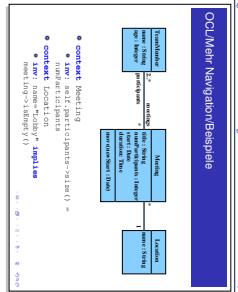

(c) Prof. Dr. P. Thiemann, <http://projektaege.informatik.uni-frankfurt.de>

context $\text{self} : \text{Transmitter} \text{ inv : } \text{age} > 18$
 $\text{self}. \text{age} > 18$
 $\text{age}(\text{self}) > 18$
 $\text{age}(\text{self}, 18)$
 $\hookrightarrow \text{all instances} \text{ to } \Rightarrow \text{forall} (\text{self} : \text{To} \mid \text{age}(\text{self}), 18)$

15.9

Examples (from lecture)

(c) Prof. Dr. P. Thiemann, <http://projektaege.informatik.uni-frankfurt.de>

Example (from lecture "Softwaretechnik 2008")

"Not Interesting"

Among others:

- Enumeration types
- Type hierarchy
- Complete list of arithmetical operators
- The two other collection types Bag and Sequence
- Casting
- Pre/post conditions
- Runtime type information
- ...

- context $\text{Meeting inv : TeamMember}^n : \text{Int} = 0 \mid n + i, \text{age}$

```
/participants->size() > 25
```
