#### **Decision Procedures**

#### Jochen Hoenicke

Winter Term 2015/16

Suppose we have a  $T_{\mathbb{Q}}$ -formulae that is not conjunctive:

$$(x \ge 0 \rightarrow y > z) \land (x+y \ge z \rightarrow y \le z) \land (y \ge 0 \rightarrow x \ge 0) \land x+y \ge z$$

Our approach so far: Converting to DNF.

Yields in 8 conjuncts that have to be checked separately.

Is there a more efficient way to prove unsatisfiability?

### CNF and Propositional Core

Suppose we have the following  $T_{\mathbb{Q}}$ -formulae:

$$(x \ge 0 \rightarrow y > z) \land (x+y \ge z \rightarrow y \le z) \land (y \ge 0 \rightarrow x \ge 0) \land x+y \ge z$$

Converting to CNF and restricting to  $\leq$ :

$$(\neg(0 \le x) \lor \neg(y \le z)) \land (\neg(z \le x + y) \lor (y \le z))$$
$$\land (\neg(0 \le y) \lor (0 \le x)) \land (z \le x + y)$$

Now, introduce boolean variables for each atom:

$$P_1: 0 \le x$$
  $P_2: y \le z$   $P_3: z \le x + y$   $P_4: 0 \le y$ 

Gives a propositional formula:

$$(\neg P_1 \lor \neg P_2) \land (\neg P_3 \lor P_2) \land (\neg P_4 \lor P_1) \land P_3$$

The core feature of the DPLL-algorithm is Unit Propagation.

$$(\neg P_1 \vee \neg P_2) \wedge (\neg P_3 \vee P_2) \wedge (\neg P_4 \vee P_1) \wedge P_3$$

The clause  $P_3$  is a unit clause; set  $P_3$  to  $\top$ .

Then  $\neg P_3 \lor P_2$  is a unit clause; set  $P_2$  to  $\top$ .

Then  $\neg P_1 \vee \neg P_2$  is a unit clause; set  $P_1$  to  $\bot$ .

Then  $\neg P_4 \lor P_1$  is a unit clause; set  $P_4$  to  $\bot$ .

Only solution is  $P_3 \wedge P_2 \wedge \neg P_1 \wedge \neg P_4$ .

## DPLL-Algorithm

Only solution is  $P_3 \wedge P_2 \wedge \neg P_1 \wedge \neg P_4$ .

$$P_1: 0 \le x \qquad \qquad P_2: y \le z$$

$$P_3: z \leq x + y \qquad \qquad P_4: 0 \leq y$$

This gives the conjunctive  $T_{\mathbb{Q}}$ -formula

$$z \leq x + y \wedge y \leq z \wedge x < 0 \wedge y < 0.$$

## DPLL(T) with Learning (CDCL)

We describe DPLL(T) by a set of rules modifying a configuration. A configuration is a triple

$$\langle M, F, C \rangle$$
,

#### where

- M (model) is a sequence of literals (that are currently set to true) interspersed with backtracking points denoted by  $\square$ .
- F (formula) is a formula in CNF,
  i. e., a set of clauses where each clause is a set of literals.
- C (conflict) is either  $\top$  or a conflict clause (a set of literals). A conflict clause C is a clause with  $F \Rightarrow C$  and  $M \not\models C$ . Thus, a conflict clause shows  $M \not\models F$ .

### Rule Based Description

We describe the algorithm by a set of rules, which each describe a set of transitions between configurations, e.g.,

Explain 
$$\frac{\langle M, F, C \cup \{\ell\} \rangle}{\langle M, F, C \cup \{\ell_1, \dots, \ell_k\} \rangle} \quad \text{where } \ell \notin C, \ \{\ell_1, \dots, \ell_k, \overline{\ell}\} \in F, \\ \text{and } \overline{\ell_1}, \dots, \overline{\ell_k} \prec \overline{\ell} \text{ in } M.$$

Here,  $\bar{\ell}_1, \ldots, \bar{\ell}_k \prec \ell$  in M means the literals  $\bar{\ell}_1, \ldots, \bar{\ell}_k$  occur in the sequence M before the literal  $\ell$  (and all literals appear in M).

**Example:** for  $M = P_1 \bar{P}_3 \bar{P}_2 \bar{P}_4$ ,  $F = \{\{P_1\}, \{P_3, \bar{P}_4\}\}$ , and  $C = \{P_2\}$  the transition

$$\langle M, F, \{P_2, P_4\} \rangle \longrightarrow \langle M, F, \{P_2, P_3\} \rangle$$

is possible.

# Rules for CDCL (Conflict Driven Clause Learning)

Decide 
$$\frac{\langle M, F, \top \rangle}{\langle M \cdot \square \cdot \ell, F, \top \rangle}$$

where  $\ell \in \mathit{lit}(F)$ ,  $\ell, \bar{\ell}$  in M

Propagate 
$$\frac{\langle M, F, \top \rangle}{\langle M \cdot \ell, F, \top \rangle}$$

where  $\{\ell_1,\ldots,\ell_k,\ell\}\in \mathcal{F}$  and  $\bar{\ell}_1,\ldots,\bar{\ell}_k$  in M,  $\ell,\bar{\ell}$  in M.

Conflict 
$$\frac{\langle M, F, \top \rangle}{\langle M, F, \{\ell_1, \dots, \ell_k\} \rangle}$$

where  $\{\ell_1,\ldots,\ell_k\}\in F$  and  $\bar{\ell_1},\ldots,\bar{\ell_k}$  in M.

Explain 
$$\frac{\langle M, F, C \cup \{\ell\} \rangle}{\langle M, F, C \cup \{\ell_1, \dots, \ell_k\} \rangle}$$

where  $\ell \notin C$ ,  $\{\ell_1, \dots, \ell_k, \bar{\ell}\} \in F$ , and  $\bar{\ell}_1, \dots, \bar{\ell}_k \prec \bar{\ell}$  in M.

Learn 
$$\frac{\langle M, F, C \rangle}{\langle M, F \cup \{C\}, C \rangle}$$

where  $C \neq \top$ ,  $C \notin F$ .

Back 
$$\frac{\langle M, F, \{\ell_1, \dots, \ell_k, \ell\} \rangle}{\langle M' \cdot \ell, F, \top \rangle}$$

where 
$$\{\ell_1,\ldots,\ell_k,\ell\} \in F$$
,  $M = M' \cdot \square \cdots \bar{\ell} \cdots$ , and  $\bar{\ell_1},\ldots,\bar{\ell_k}$  in  $M'$ .

## Example: DPLL with Learning

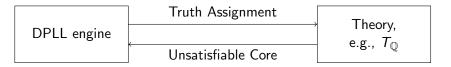

$$P_1 \wedge (\neg P_2 \vee P_3) \wedge (\neg P_4 \vee P_3) \wedge (P_2 \vee P_4) \wedge (\neg P_1 \vee \neg P_4 \vee \neg P_3) \wedge (P_4 \vee \neg P_3)$$

The algorithm starts with 
$$M = \epsilon$$
,  $C = \top$  and  $F = \{\{P_1\}, \{\bar{P}_2, P_3\}, \{\bar{P}_4, P_3\}, \{P_2, P_4\}, \{\bar{P}_1, \bar{P}_4, \bar{P}_3\}, \{P_4, \bar{P}_3\}\}$ .  $\langle \epsilon, F, \top \rangle \stackrel{\mathsf{Propagate}}{\longrightarrow} \langle P_1, F, \top \rangle \stackrel{\mathsf{Decide}}{\longrightarrow} \langle P_1 \Box \bar{P}_2, F, \top \rangle \stackrel{\mathsf{Propagate}}{\longrightarrow} \langle P_1 \Box \bar{P}_2 P_4, F, \top \rangle \stackrel{\mathsf{Propagate}}{\longrightarrow} \langle P_1 \Box \bar{P}_2 P_4 P_3, F, \top \rangle \stackrel{\mathsf{Conflict}}{\longrightarrow} \langle P_1 \Box \bar{P}_2 P_4 P_3, F, \{\bar{P}_1, \bar{P}_4\}\rangle \stackrel{\mathsf{Explain}}{\longrightarrow} \langle P_1 \Box \bar{P}_2 P_4 P_3, F, \{\bar{P}_1, \bar{P}_4\}\rangle \stackrel{\mathsf{Explain}}{\longrightarrow} \langle P_1 \Box \bar{P}_2 P_4 P_3, F', \{\bar{P}_1, \bar{P}_4\}\rangle \stackrel{\mathsf{Explain}}{\longrightarrow} \langle P_1 \Box \bar{P}_2 P_4 P_3, F', \{\bar{P}_1, \bar{P}_4\}\rangle \stackrel{\mathsf{Explain}}{\longrightarrow} \langle P_1 \bar{P}_4 P_2 P_3, F', \{P_4, \bar{P}_3\}\rangle \stackrel{\mathsf{Explain}}{\longrightarrow} \langle P_1 \bar{P}_4 P_2 P_3, F', \{P_4, \bar{P}_3\}\rangle \stackrel{\mathsf{Explain}}{\longrightarrow} \langle P_1 \bar{P}_4 P_2 P_3, F', \{P_4\}\rangle \stackrel{\mathsf{Explain}}{\longrightarrow} \langle P_1 \bar{P}_4 P_2 P_3, F', \{\bar{P}_1\}\rangle \stackrel{\mathsf{Explain}}{\longrightarrow} \langle P_1 \bar{P}_4 P_2 P_3, F', \emptyset\rangle \stackrel{\mathsf{Learn}}{\longrightarrow} \langle P_1 \bar{P}_4 P_2 P_3, F', \emptyset\rangle$ 

where  $F' = F \cup \{\{\bar{P_1}, \bar{P_4}\}\}.$ 

The DPLL/CDCL algorithm is combined with a Decision Procedures for a Theory

DPLL takes the propositional core of a formula, assigns truth-values to atoms.

Theory takes a conjunctive formula (conjunction of literals), returns a minimal unsatisfiable core.

Suppose we have a decision procedure for a conjunctive theory, e.g., Simplex Algorithm for  $T_{\mathbb{Q}}$ .

Given an unsatisfiable conjunction of literals  $\ell_1 \wedge \cdots \wedge \ell_n$ . Find a subset UnsatCore  $= \{\ell_{i_1}, \dots, \ell_{i_m}\}$ , such that

- $\ell_{i_1} \wedge \ldots \wedge \ell_{i_m}$  is unsatisfiable.
- For each subset of UnsatCore the conjunction is satisfiable.

Possible approach: check for each literal whether it can be omitted.  $\longrightarrow n$  calls to decision procedure.

Most decision procedures can give small unsatisfiable cores for free.

#### Theory returns an unsatisfiable core:

- a conjunction of literals from current truth assignment
- that is unsatisfible.

#### DPLL learns conflict clauses, a disjunction of literals

- that are implied by the formula
- and in conflict to current truth assignment.

Thus the negation of an unsatisfiable core is a conflict clause.

The DPLL part only needs one new rule:

TConflict 
$$\frac{\langle M, F, \top \rangle}{\langle M, F, C \rangle}$$

TConflict  $\frac{\langle M, F, \top \rangle}{\langle M, F, C \rangle}$  where M is unsatisfiable in the theory and  $\neg C$  an unsatisfiable core of M.

$$F: y \geq 1 \land (x \geq 0 \rightarrow y \leq 0) \land (x \leq 1 \rightarrow y \leq 0)$$

Atomic propositions:

$$P_1: y \ge 1 \qquad \qquad P_2: x \ge 0$$

$$P_3: y \le 0$$
  $P_4: x \le 1$ 

Propositional core of *F* in CNF:

$$F_0: (P_1) \wedge (\neg P_2 \vee P_3) \wedge (\neg P_4 \vee P_3)$$

$$\begin{array}{lll} F_0: & \{\{P_1\},\{\bar{P}_2,P_3\},\{\bar{P}_4,P_3\}\} \\ P_1: & y \geq 1 & P_2: & x \geq 0 & P_3: & y \leq 0 & P_4: & x \leq 1 \\ \\ \langle \epsilon,F_0,\top\rangle & \overset{\mathsf{Propagate}}{\longrightarrow} & \langle P_1,F_0,\top\rangle & \overset{\mathsf{Decide}}{\longrightarrow} & \langle P_1\Box P_3,F_0,\top\rangle & \overset{\mathsf{TConflict}}{\longrightarrow} \\ \langle P_1\Box P_3,F_0,\{\bar{P}_1,\bar{P}_3\}\rangle & \overset{\mathsf{Learn}}{\longrightarrow} & \langle P_1\Box P_3,F_1,\{\bar{P}_1,\bar{P}_3\}\rangle & \overset{\mathsf{Back}}{\longrightarrow} \\ \langle P_1\bar{P}_3,F_1,\top\rangle & \overset{\mathsf{Propagate}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2,F_1,\top\rangle & \overset{\mathsf{Propagate}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\top\rangle & \overset{\mathsf{TConflict}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{P_2,P_4\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{P_2,P_3\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{P_3\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Explain}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Learn}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Learn}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Learn}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}{\longrightarrow} \\ \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\{\bar{P}_1\}\rangle & \overset{\mathsf{Learn}}{\longrightarrow} & \langle P_1\bar{P}_3\bar{P}_2\bar{P}_4,F_1,\emptyset\rangle & \overset{\mathsf{Learn}}$$

No further step is possible; the formula F is unsatisfiable.

## Correctness of DPLL(T)

### Theorem (Correctness of DPLL(T))

Let F be a  $\Sigma$ -formula and F' its propositional core. Let

$$\langle \epsilon, F', \top \rangle = \langle M_0, F_0, C_0 \rangle \longrightarrow \ldots \longrightarrow \langle M_n, F_n, C_n \rangle$$

be a maximal sequence of rule application of DPLL(T).

Then F is T-satisfiable iff  $C_n$  is  $\top$ .

Before proving the theorem, we note some important invariants:

- $M_i$  never contains a literal more than once.
- $M_i$  never contains  $\ell$  and  $\bar{\ell}$ .
- Every  $\square$  in  $M_i$  is followed immediately by a literal.
- If  $C_i = \{\ell_1, \ldots, \ell_k\}$  then  $\bar{\ell_1}, \ldots, \bar{\ell_k}$  in M.
- $C_i$  is always implied by  $F_i$  (or the theory).
- F is equivalent to  $F_i$  for all steps i of the computation.
- If a literal  $\ell$  in M is not immediately preceded by  $\square$ , then F contains a clause  $\{\ell, \ell_1, \dots, \ell_k\}$  and  $\bar{\ell_1}, \dots, \bar{\ell_k} \prec \ell$  in M.

## Correctness proof

Proof: If the sequence ends with  $\langle M_n, F_n, \top \rangle$  and there is no rule applicable, then:

- Since Decide is not applicable, all literals of  $F_n$  appear in  $M_n$  either positively or negatively.
- Since Conflict is not applicable, for each clause at least one literal appears in  $M_n$  positively.
- Since TConflict is not applicable, the conjunction of truth assignments of  $M_n$  is satisfiable by a model I.

Thus, I is a model for  $F_n$ , which is equivalent to F.

If the sequence ends with  $\langle M_n, F_n, C_n \rangle$  with  $C_n \neq \top$ . Assume  $C_n = \{\ell_1, \dots, \ell_k, \ell\} \neq \emptyset$ . W.l.o.g.,  $\bar{\ell_1}, \dots, \bar{\ell_k} \prec \bar{\ell}$ . Then:

- Since Learn is not applicable,  $C_n \in F_n$ .
- Since Explain is not applicable  $\bar{\ell}$  must be immediately preceded by  $\Box$ .
- However, then Back is applicable, contradiction!

Therefore, the assumption was wrong and  $C_n = \emptyset (= \bot)$ .

Since F implies  $C_n$ , F is not satisfiable.

### Theorem (Termination of DPLL)

Let F be a propositional formula. Then every sequence

$$\langle \epsilon, F, \top \rangle \, = \, \langle \textit{M}_0, \textit{F}_0, \textit{C}_0 \rangle \, \longrightarrow \, \langle \textit{M}_1, \textit{F}_1, \textit{C}_1 \rangle \, \longrightarrow \, \ldots$$

terminates.

### **Proof of Total Correctness**

We define some well-ordering on the domains:

- We define  $M \prec M'$  if  $M \square \square$  comes lexicographically before  $M' \square \square$ , where every literal is considered to be smaller than  $\square$ .
  - Example:  $\ell_1\ell_2(\Box\Box) \prec \ell_1\Box\bar{\ell_2}\ell_3(\Box\Box) \prec \ell_1\Box\bar{\ell_2}(\Box\Box) \prec \ell_1(\Box\Box)$

• For a sequence 
$$M = \bar{\ell}_1 \dots \bar{\ell}_n$$
, the conflict clauses are ordered by:  $C \prec_M C'$ , iff  $C \neq \top, C' = \top$  or for some  $k \leq n$ :  $C \cap \{\ell_{k+1}, \dots, \ell_n\} = C' \cap \{\ell_{k+1}, \dots \ell_n\}$  and  $\ell_k \notin C, \ell_k \in C'$ . **Example**:  $\emptyset \prec_{\bar{\ell}_1\bar{\ell}_2\bar{\ell}_3} \{\ell_2\} \prec_{\bar{\ell}_1\bar{\ell}_2\bar{\ell}_3} \{\ell_1, \ell_3\} \prec_{\bar{\ell}_1\bar{\ell}_2\bar{\ell}_3} \{\ell_2, \ell_3\} \prec_{\bar{\ell}_1\bar{\ell}_2\bar{\ell}_3} \top$ 

These are well-orderings, because the domains are finite.

Termination Proof: Every rule application decreases the value of  $\langle M_i, F_i, C_i \rangle$  according to the well-ordering:

$$\langle M, F, C \rangle \prec \langle M', F', C' \rangle, \text{ iff } \begin{cases} M \prec M', \\ \text{or } M = M', C \prec_M C', \\ \text{or } M = M', C = C', C \in F, C \notin F'. \end{cases}$$
