# From Core State Machines to LTS

Definition. Let  $\mathscr{S}_0 = (\mathscr{T}_0, \mathscr{C}_0, V_0, atr_0, \mathscr{E})$  be a signature with signals (all classes in  $\mathscr{C}_0$  active),  $\mathscr{D}_0$  a structure of  $\mathscr{S}_0$ , and  $(Eth, ready, \oplus, \ominus, [\cdot])$  an ether over  $\mathscr{S}_0$  and  $\mathscr{D}_0$ . Assume there is one core state machine  $M_C$  per class  $C \in \mathscr{C}$ . We say, the state machines induce the following labelled transition relation on states  $S := (\Sigma_{\mathscr{S}}^{\mathscr{D}} \times Eth) \dot{\cup} \{\#\}$  with labels  $A := 2^{\mathscr{D}(\mathscr{E})} \times 2^{(\mathscr{D}(\mathscr{E}) \dot{\cup} \{*,+\}) \times \mathscr{D}(\mathscr{C})} \times \mathscr{D}(\mathscr{C})$ : •  $(\sigma, \varepsilon) \xrightarrow{(cons,Snd)}_u (\sigma', \varepsilon')$ if and only if (i) an event with destination u is discarded, (ii) an event is dispatched to u, i.e. stable object processes an event, or (iii) run-to-completion processing by u continues, i.e. object u is not stable and continues to process an event, (iv) the environment interacts with object u, •  $s \xrightarrow{(cons, \emptyset)} \#$ if and only if (v) an error condition occurs during consumption of cons, or s = # and  $cons = \emptyset$ .

$$(\sigma, \varepsilon) \xrightarrow[u]{(cons,Snd)} (\sigma', \varepsilon')$$

if

• an E-event (instance of signal E) is ready in  $\varepsilon$  for object u of a class  $\mathscr{C}$ , i.e. if

$$u \in \operatorname{dom}(\sigma) \cap \mathscr{D}(C) \land \exists u_E \in \mathscr{D}(E) : u_E \in ready(\varepsilon, u)$$

- u is stable and in state machine state s, i.e.  $\sigma(u)(stable) = 1$  and  $\sigma(u)(st) = s$ ,
- but there is no corresponding transition enabled (all transitions incident with current state of u either have other triggers or the guard is not satisfied)

$$\forall (s, F, expr, act, s') \in \to (\mathcal{SM}_C) : F \neq E \lor I\llbracket expr \rrbracket(\sigma, u) = 0$$

and

2016-12-15 - Sstmrtd

-13-

- in the system configuration, stability may change,  $u_E$  goes away, i.e.

$$\sigma' = \sigma[u.stable \mapsto b] \setminus \{u_E \mapsto \sigma(u_E)\}$$

- where b = 0 if and only if there is a transition with trigger '\_' enabled for u in  $(\sigma', \varepsilon')$ .
- the event  $u_E$  is removed from the ether, i.e.

$$\varepsilon' = \varepsilon \ominus u_E,$$

• consumption of  $u_E$  is observed, i.e.

$$cons = \{u_E\}, \quad Snd = \emptyset.$$
 5/39

$$(\sigma,\varepsilon) \xrightarrow[u]{(cons,Snd)} (\sigma',\varepsilon')$$

if

- $u \in \operatorname{dom}(\sigma) \cap \mathscr{D}(C) \land \exists u_E \in \mathscr{D}(E) : u_E \in ready(\varepsilon, u)$
- u is stable and in state machine state s, i.e.  $\sigma(u)(stable) = 1$  and  $\sigma(u)(st) = s$ ,
- a transition is **enabled**, i.e.

$$\exists (s, F, expr, act, s') \in \to (\mathcal{SM}_C) : F = E \land I\llbracket expr \rrbracket (\tilde{\sigma}, u) = 1$$

where  $\tilde{\sigma} = \sigma[u.params_E \mapsto u_E]$ .

#### and

- 13 - 2016-12-15 - Sstmrtc

•  $(\sigma', \varepsilon')$  results from applying  $t_{act}$  to  $(\sigma, \varepsilon)$  and removing  $u_E$  from the ether, i.e.

$$(\sigma'',\varepsilon') \in t_{act}[u](\tilde{\sigma},\varepsilon \ominus u_E),$$
  
$$\sigma' = (\sigma''[u.st \mapsto s', u.stable \mapsto b, u.params_E \mapsto \emptyset])|_{\mathscr{D}(\mathscr{C}) \setminus \{u_E\}}$$

where b depends (see (i))

• Consumption of  $u_E$  and the side effects of the action are observed, i.e.

$$cons = \{u_E\}, \quad Snd = Obs_{t_{act}}[u](\tilde{\sigma}, \varepsilon \ominus u_E).$$

$$(\sigma, \varepsilon) \xrightarrow[u]{(cons,Snd)} (\sigma', \varepsilon')$$

if

• there is an unstable object u of a class  $\mathscr{C}$  , i.e.

$$u \in \operatorname{dom}(\sigma) \cap \mathscr{D}(C) \wedge \sigma(u)(stable) = 0$$

#### and

• there is a transition without trigger enabled from the current state  $s = \sigma(u)(st)$ , i.e.

,

$$\exists (s, \_, expr, act, s') \in \to (\mathcal{SM}_C) : I\llbracket expr \rrbracket(\sigma, u) = 1$$

and

- 13 - 2016-12-15 - Sstmrtcrules

•  $(\sigma', \varepsilon')$  results from applying  $t_{act}$  to  $(\sigma, \varepsilon)$ , i.e.

$$(\sigma'', \varepsilon') \in t_{act}[u](\sigma, \varepsilon), \quad \sigma' = \sigma''[u.st \mapsto s', u.stable \mapsto b]$$

where *b* depends as before.

- Only the side effects of the action are observed, i.e.  $cons = \emptyset$ ,  $Snd = Obs_{tact}[u](\sigma, \varepsilon)$ .
- $\sigma' = \sigma[u.stable \mapsto 1], \varepsilon' = \varepsilon, cons = \emptyset, Snd = \emptyset$ , otherwise.

### (iv) Environment Interaction

Assume that a set  $\mathscr{E}_{env} \subseteq \mathscr{E}$  is designated as **environment events** and a set of attributes  $V_{env} \subseteq V$  is designated as **input attributes**.

Then

$$(\sigma, \varepsilon) \xrightarrow{(cons,Snd)}_{env} (\sigma', \varepsilon')$$

if either (!)

• an environment event  $E \in \mathscr{E}_{env}$  is spontaneously sent to an alive object  $u \in dom(\sigma)$ , i.e.

 $\sigma' = \sigma \cup \{ u_E \mapsto \{ v_i \mapsto d_i \mid 1 \le i \le n \}, \quad \varepsilon' = \varepsilon \oplus (u, u_E)$ 

where  $u_E \notin \operatorname{dom}(\sigma)$  and  $atr(E) = \{v_1, \ldots, v_n\}$ .

• Sending of the event is observed, i.e.  $cons = \emptyset$ ,  $Snd = \{u_E, \}$ .

or

•  $\varepsilon' = \varepsilon$ .

2016-12-15 - Sstmrtc

• Values of input attributes change freely in alive objects, i.e.

$$\forall v \in V \,\forall u \in \operatorname{dom}(\sigma) : \sigma'(u)(v) \neq \sigma(u)(v) \implies v \in V_{env}$$

and no objects appear or disappear, i.e.  $dom(\sigma') = dom(\sigma)$ .

## (v) Error Conditions

$$s \xrightarrow{(cons,Snd)} \#$$

if, in (i), (ii), or (iii),

- I[[expr]] is not defined for  $\sigma$  and u, or
- $t_{act}[u]$  is not defined for  $(\sigma, \varepsilon)$ ,

and

•  $cons = \emptyset$ , and  $Snd = \emptyset$ .

$$E[x/0]/act \qquad s_2$$

$$E[x/0]/act \qquad s_2$$

$$E[true]/act \qquad s_3$$

• 
$$s_1 \xrightarrow{E[expr]/x := x/0} s_2$$

Transition Relation, Computation

- 13 - 2016-12-15 - main

**Definition.** Let A be a set of labels and S a (not necessarily finite) set of of states. We call  $\rightarrow \subseteq S \times A \times S$ a (labelled) transition relation. Let  $S_0 \subseteq S$  be a set of initial states. A (finite or infinite) sequence  $s_0 \xrightarrow{a_0} s_1 \xrightarrow{[a_1]{a_1}{a_1}} s_2 \xrightarrow{a_2} \dots$ with  $s_i \in S$ ,  $a_i \in A$  is called computation  $[s_i \neq f_{ing} \neq s_0]$ of the labelled transition system  $(S, A, \rightarrow, S_0)$  if and only if [• initiation:  $s_0 \in S_0$ ] • consecution:  $(s_i, a_i, s_{i+1}) \in \rightarrow$  for  $i \in \mathbb{N}_0$ . Step and Run-to-Completion

**17**/39

# Notions of Steps: The Step

Note: we call one evolution

$$(\sigma,\varepsilon) \xrightarrow[u]{(cons,Snd)} (\sigma',\varepsilon')$$

a **step**.

Thus in our setting, a step often<sup>1</sup> directly corresponds to

**one object** (namely *u*) taking **a single transition** between regular states.

(We will extend the concept of "single transition" for hierarchical state machines.)

 $^{1}:$  In case of dispatch and continue with enabled transition.

That is: We're going for an interleaving semantics without true parallelism.

#### What is a run-to-completion step...?

• Intuition: a maximal sequence of steps of one object, where the first step is a dispatch step, all later steps are continue steps, and the last step establishes stability (or object disappears).

Note: while one step corresponds to one transition in the state machine, a run-to-completion step is in general not syntacically definable:

one transition may be taken multiple times during an RTC-step.

#### Example:

**19**/39

Notions of Steps: The Run-to-Completion Step Cont'd

#### Proposal: Let

2016-12-15 -- 13 -

$$(\sigma_0, \varepsilon_0) \xrightarrow{(cons_0, Snd_0)} \dots \xrightarrow{(cons_{n-1}, Snd_{n-1})} (\sigma_n, \varepsilon_n), \quad n > 0$$

be a finite (!), non-empty, maximal, consecutive sequence such that

- $(cons_0, Snd_0)$  indicates dispatching to  $u := u_0$  (by Rule (ii)), i.e.  $cons = \{u_E\}, u_E \in dom(\sigma_0) \cap \mathscr{D}(\mathscr{E}),$
- if *u* becomes stable or disappears, then in the last step, i.e.

 $\forall i > 0 \bullet (\sigma_i(u)(stable) = 1 \lor u \notin \operatorname{dom}(\sigma_i)) \implies i = n$ 

Let  $0 = k_1 < k_2 < \cdots < k_N < n$  be the maximal sequence of indices such that  $u_{k_i} = u$  for  $1 \le i \le N$ . Then we call the sequence

$$(\sigma_0(u) =) \quad \sigma_{k_1}(u), \sigma_{k_2}(u) \dots, \sigma_{k_N}(u), \sigma_n(u)$$

a (!) run-to-completion step of u (from (local) configuration  $\sigma_0(u)$  to  $\sigma_n(u)$ ).

X E/ K

### Divergence

We say, object u can diverge on reception  $cons_0$  from (local) configuration  $\sigma_0(u)$  if and only if there is an infinite, consecutive sequence

$$(\sigma_0, \varepsilon_0) \xrightarrow{(cons_0, Snd_0)} (\sigma_1, \varepsilon_1) \xrightarrow{(cons_1, Snd_1)} \dots$$

where  $u_i = u$  for infinitely many  $i \in \mathbb{N}_0$  and  $\sigma_i(u)(stable) = 0$ , i > 0, i.e. u does not become stable again.

21/39

### Run-to-Completion Step: Discussion.

Our definition of RTC-step takes a global and non-compositional view, that is:

- In the projection onto a single object we still **see** the effect of interaction with other objects.
- Adding classes (or even objects) may change the divergence behaviour of existing ones.
- Compositional would be:

the behaviour of a set of objects is determined by the behaviour of each object "in isolation". Our semantics and notion of RTC-step doesn't have this (often desired) property.

- 13 - 2016-12-15 - Sstmstep -

Our definition of RTC-step takes a global and non-compositional view, that is:

- In the projection onto a single object we still see the effect of interaction with other objects.

Can we give (syntactical) criteria such that any (global) run-to-completion step is an interleaving of local ones?

### Maybe: Strict interfaces.

- (A): Refer to private features only via "self".
   (Recall that other objects of the same class can modify private attributes.)
- (B): Let objects only communicate by events, i.e. don't let them modify each other's local state via links at all.

(Proof left as exercise...)

2016-12-15 - Sstmstep

Putting It All Together

**23**/39

# Initial States

**Recall**: a labelled transition system is  $(S, A, \rightarrow, S_0)$ . We have

- S: system configurations  $(\sigma, \varepsilon)$
- $\rightarrow$ : labelled transition relation  $(\sigma, \varepsilon) \xrightarrow[u]{(cons,Snd)} u (\sigma', \varepsilon')$ .

**Wanted**: initial states  $S_0$ .

### Initial States

**Recall**: a labelled transition system is  $(S, A, \rightarrow, S_0)$ . We have

- S: system configurations  $(\sigma, \varepsilon)$
- $\rightarrow$ : labelled transition relation  $(\sigma, \varepsilon) \xrightarrow{(cons, Snd)} (\sigma', \varepsilon')$ .

**Wanted**: initial states  $S_0$ .

#### Proposal:

Require a (finite) set of **object diagrams**  $\mathscr{O}\mathscr{D}$  as part of a UML model

 $(\mathcal{CD}, \mathcal{SM}, \mathcal{OD}).$ 

And set

- 13 - 2016-12-15 - Stogether

$$S_0 = \{(\sigma, \varepsilon) \mid \sigma \in G^{-1}(\mathcal{OD}), \quad \mathcal{OD} \in \mathscr{OD}, \quad \varepsilon \text{ empty} \}.$$

24/39

### Initial States

**Recall**: a labelled transition system is  $(S, A, \rightarrow, S_0)$ . We have

- S: system configurations  $(\sigma, \varepsilon)$
- $\rightarrow$ : labelled transition relation  $(\sigma, \varepsilon) \xrightarrow{(cons,Snd)} (\sigma', \varepsilon')$ .

**Wanted**: initial states  $S_0$ .

#### Proposal:

Require a (finite) set of **object diagrams**  $\mathscr{OD}$  as part of a UML model

(CD, SM, OD).

And set

$$S_0 = \{ (\sigma, \varepsilon) \mid \sigma \in G^{-1}(\mathcal{OD}), \quad \mathcal{OD} \in \mathscr{OD}, \quad \varepsilon \text{ empty} \}.$$

Other Approach: (used by Rhapsody tool) multiplicity of classes (plus initialisation code). We can read that as an abbreviation for an object diagram.

#### The semantics of the UML model

$$\mathcal{M} = (\mathscr{CD}, \mathscr{SM}, \mathscr{OD})$$

where

-13 - 2016-12-15 - Stogether

- some classes in *CD* are stereotyped as 'signal' (standard), some signals and attributes are stereotyped as 'external' (non-standard),
- there is a 1-to-1 relation between classes and state machines,
- $\mathscr{OD}$  is a set of object diagrams over  $\mathscr{CD}$ ,

is the transition system  $(S, A, \rightarrow, S_0)$  constructed on the previous slide(s).

The computations of  $\mathcal{M}$  are the computations of  $(S, A, \rightarrow, S_0)$ .

25/39

### OCL Constraints and Behaviour

- Let  $\mathcal{M} = (\mathscr{CD}, \mathscr{SM}, \mathscr{OD})$  be a UML model.
- We call  $\mathcal{M}$  consistent iff, for each OCL constraint  $expr \in Inv(\mathscr{CD})$ ,

 $\sigma \models expr$  for each "reasonable point"  $(\sigma, \varepsilon)$  of computations of  $\mathcal{M}$ .

(Cf. tutorial for discussion of "reasonable point".)

Note: we could define  $Inv(\mathscr{GM})$  similar to  $Inv(\mathscr{CD})$ .

### OCL Constraints and Behaviour

- Let  $\mathcal{M} = (\mathscr{CD}, \mathscr{SM}, \mathscr{OD})$  be a UML model.
- We call  $\mathcal{M}$  consistent iff, for each OCL constraint  $expr \in Inv(\mathscr{CD})$ ,
  - $\sigma \models expr$  for each "reasonable point"  $(\sigma, \varepsilon)$  of computations of  $\mathcal{M}$ .

(Cf. tutorial for discussion of "reasonable point".)

Note: we could define  $Inv(\mathscr{SM})$  similar to  $Inv(\mathscr{CD})$ .

#### Pragmatics:

- In UML-as-blueprint mode, if *M* doesn't exist yet, then providing *M* = (*CD*, Ø, *OD*) is typically asking the developer to provide state machines *M* such that *M*' = (*CD*, *M*, *OD*) is consistent. If the developer makes a mistake, then *M*' is inconsistent.
- Not so common (but existing):

If  $\mathscr{S\!M}$  is given, then constraints are also considered when choosing transitions in the RTC-algorithm.

In other words: even in presence of "mistakes", the state machines in  $\mathscr{SM}$  never move to inconsistent configurations.

26/39

Rhapsody Demo III: Model Animation

- State Machines induce a labelled transition system.
- There are five kinds of transitions in the LTS:
  - discard, dispatch, continue, environment, error.
- For now, we assume that all classes are active, thus steps of objects may interleave.
- We distinguish steps and run-to-completion step.
- Initial states can be characterised using object diagrams.
- Missing transformers:
  - **Create**: re-use identities vs. use fresh ones.
  - > next time • Destroy: allow dangling references vs. clean up.

37/39
