Exercise 1: Safety & Liveness

Consider the categories (a)-(d) of linear-time properties below. For each of them, give two examples of properties that fall into this category: a safety property and a liveness property (if such examples exist). If no example exists, argue why this is the case.

△ Careful reading required. △

(a) A property $E$ is in this category, if for every trace $\pi = A_0A_1A_2\ldots$ with $\pi \models E$, it is sufficient to examine a finite prefix $A_0A_1\ldots A_n$ of $\pi$ to determine that $\pi$ satisfies property $E$. 

(b) A property $E$ is in this category, if it is not sufficient for every trace $\pi = A_0A_1A_2\ldots$ with $\pi \models E$ to examine a finite prefix $A_0A_1\ldots A_n$ of $\pi$ to determine that $\pi$ satisfies property $E$. Instead, in some cases the whole trace must be examined.

(c) A property $E$ is in this category, if for every trace $\pi = A_0A_1A_2\ldots$ with $\pi \not\models E$, it is sufficient to examine a finite prefix $A_0A_1\ldots A_n$ of $\pi$ to determine that $\pi$ violates property $E$.

(d) A property $E$ is in this category, if it is not sufficient for every trace $\pi = A_0A_1A_2\ldots$ with $\pi \not\models E$ to examine a finite prefix $A_0A_1\ldots A_n$ of $\pi$ to determine that $\pi$ violates property $E$. Instead, in some cases the whole trace must be examined.

Exercise 2: Safety-Liveness Decomposition

The goal of this exercise is to understand the relation between any LT property and safety and liveness properties, by applying the decomposition theorem.

According to the decomposition theorem, any LT property $P$ can be decomposed into a safety property $P_{safe}$ and a liveness property $P_{live}$, such that the property $P$ is equal to their intersection, i.e.,

$$ P = P_{safe} \cap P_{live} $$

Apply the construction in the proof of the decomposition theorem to find the decomposition for the following properties with $AP = \{a, b\}$. In particular, for each property, give its closure. Use set notation to express $P_{safe}$ and $P_{live}$.

$(P_1)$ Every $a$ is immediately followed by $b$. 

1
(P_2) The atomic proposition \( a \) holds infinitely often.

(P_3) At exactly 3 points of time, \( a \) holds.

(P_4) \( a \) holds initially and infinitely often.

(P_5) True

**Hint:** Some tasks may require very little work.

**Exercise 3: Model Checking**

In this exercise, we arrive at a goal towards which we have worked since the beginning of the semester: For a cyber-physical system (given as a transition system) and desired correctness properties, we are able to determine if the system satisfies these properties.

The following transition system \( T \) models the behaviour of a traffic light.

\[
\begin{array}{c}
\text{\{red\}} \to s_0 \to \text{\{red, yellow\}} \to s_1 \to s_3 \to \text{\{yellow\}} \to s_2 \to \text{\{green\}}
\end{array}
\]

(a) Draw an NFA \( A_T \) over the alphabet \( \Sigma = \mathcal{2}^{AP} \) with \( AP = \{\text{red, yellow, green}\} \) such that \( A_T \) accepts exactly the finite prefixes of \( \text{Traces}(T) \), i.e., \( L(A_T) = \text{pref}(\text{Traces}(T)) \).

**Note:** You can construct \( A_T \) as you prefer, you do not necessarily need to follow the construction introduced in the lecture (it still has to accept the correct language of course).

(b) Consider the following safety properties:

(P_1) “It is always the case that if the green light is on, then the red light will be off in the next step.”

(P_2) “It is always the case that if the red light is on, then the green light will be off in the next step.”

Give automata for the bad prefixes of these properties, i.e., draw NFAs \( A_{P_1} \) and \( A_{P_2} \) that accept exactly the bad prefixes of the property \( P_1 \) respectively \( P_2 \).

**Note:** You can (but you don’t have to) draw the automata in symbolic notation, i.e., with propositional formulas as edge labels.

(c) Draw the intersection NFAs of \( A_T \) with \( A_{P_1} \) respectively \( A_{P_2} \). For both intersection NFAs, check if the accepted language is empty (i.e., no accepting state can be reached) to determine if \( T \) satisfies the respective property.
